Taylorism, Targets, Technology And Teams - Compatible Concepts? Evidence From A Us Call Centre

Ray Hingst* and Kevin Lowe**

Taylorism, targets and technology form a potent mix in call centres where groups of individuals are asked to perform as “teams”. In this paper we explore how ‘task’ oriented concepts interact with the ‘interpersonal relationship’ realm in an environment where group life dominates the notional foundation of a call centre’s organisational structure. Tuckman’s four stage model of sequential group development serves as the theoretical lens through which the role ‘teams’ play in the working environment of a large call centre is examined. Our analysis of structured interviews conducted in an outbound, financial services call centre in the southern United States reveals the mechanisms by which agents have interpreted their ‘team charter’ to focus on individual achievement of increased remuneration levels. The interplay between these variables indicate that reward mechanisms associated with simple Taylorist targets, imposed on the entry level call centre agents, mitigate against meaningful group development. The advancement through promotion based on individual performance to more challenging, less target based work, is in sharp contrast to their initial training period where ‘team building’ is an essential ingredient of skills acquisition.

Field of Research: Leadership, Team processes, Group processes, Group dynamics

1. Introduction

Frederick Taylor attempted to bring order to the production function following the chaos of the industrial revolution. His principles of scientific management represented a quest in the perennial search of ‘the one best way’ to perform the sequential components of any given task. (Robbins et al., 2005: 587, Schermerhorn, 2002) Targets were a central feature of Taylor’s methodology and served both to cement the role of the manager as supervisor and to deconstruct tasks enabling the selection of workers better suited to the requirements of the job. (Samson and Daft, 2003) By providing the tools to measure and compare work output against standards, scientific management

established enduring techniques which have found a ready application in the technology-rich environment of the contemporary call centre. (Bain et al., 2002, Bain and Taylor, 2000, Baldry et al., 1998, Wallace and Hetherington, 2003, Wallace and Eagleson, 2004, Taylor and Bain, 1999) Or do they? This paper will present findings from interview data gathered in a large financial services call centre in the southern United States to examine the relationship between workers and ‘teams’ in a Taylorist, target driven environment. It will be shown that, paradoxically, some workers have the ability to use the telecommunications and information technology that dominates their workspace, to exercise creative, ‘outside the box’ problem solving techniques to maximise their individual remuneration from a target focused compensation system while establishing and maintaining effective interpersonal relationships with their team colleagues.

2. Literature Review

Technology is the most obvious link between the contemporary call centre and Taylorism. From the management and distribution of calls in queues to the calculation and assignment of roster schedules using Erlang’s queuing theories (Wallace and Hetherington, 2003) to provision of the mechanism for monitoring of performance and achievement of service level targets (Wallace and Eagleson, 2004). Wallace and Eagleson define technology in a call centre context as: ‘computer hardware, software and any output or artefact produced by the computer system in the workplaces being studied.’ (Wallace and Eagleson, 2004: 155) For simplicity of reference, we also include the telecommunications systems upon which call centres depend within the compass of technology. Taylor and Bain identify Automatic Call Distribution (ACD), and Interactive Voice Recognition (IVR) as vital components of the call centre technology mix, (Taylor and Bain, 1999) although in this respect we accept the acronym IVR to be Interactive Voice Response, a customer interface with their telephone which assists queue allocation to distinguish from Voice Recognition (VR) technology which is rapidly improving in sophistication and accuracy and has the potential to reshape much of the activity conducted by workers in call centres.

3. Methodology and Research Design

The data for this paper was collected by extended, structured interview of members of a call centre located in a southern state on the east coast of the United States of America. It ranks as the second largest in the close proximity of the city which hosts four relatively large (>500 seats), and a number of smaller call centres. The subject call centre supported the financial services industry and was structured into three distinct areas: Inbound (>850 seats); Outbound (>850 seats); and, Training (80 places; four teams of 20 trainees). Training occurred on a continuous basis throughout the year to address the staff turnover needs of the centre. Interview participants were selected from the outbound side of the operation which concentrated on the recovery of overdue accounts. After their initial employment training new agents were placed in the loss recovery, or ‘front end’, queue. Some staff were employed on the floor in the teams they commenced their training with, while others supplemented numbers in pre-existing teams.

The outbound business was broadly structured around four queues, each served by multiple teams of 15-20 members. The queues were based upon graduated progression of the overdue accounts commencing with the ‘front end’ queue which attended to debt outside the account terms by >30 to <60 days. The next queue concentrated on recovering >60 to <90 days overdue accounts before the work advanced to the >90 day teams. Finally, the ‘loss recovery’ team engaged in the least structured work of all, attempted to recover customers’ debts prior to legal action being initiated. The usual progression for staff in the outbound operation was, having gained experience ‘on the floor’ of the call centre, agents were ‘promoted’ to join existing teams recovering progressively more overdue debts. The portion of agents’ remuneration linked to performance targets increased in direct correlation to the period the debt was outstanding.

Data was collected by extended, structured interview of workers drawn from teams engaged in ‘front end’ debt recovery and from team members of the queue servicing accounts >90 days overdue and loss recovery teams. Audio recordings were made of each interview from which transcripts were prepared for analysis. Written consent was obtained from each interviewee and participation in the process was voluntary. A total of ten employees were interviewed by two investigators. Participants were selected as a representative sample of the various queues based on their rostered availability from work schedules. The gender of interviewees was broadly representative of the distribution within the outbound operation at a ratio of six female to four male staff. The Call Center Manager required, for the stated reason of security, that a public relations officer be in attendance during all interviews. Their presence however, resulted in minimal intrusion into the conduct of the data collection. Each interview was scheduled for forty minutes with the longest interview exceeding sixty minutes. In addition to these interviews, the manager of the call centre provided an overview of the organisation and the call centre operation.
Interviews were broadly structured around questions structured into four sections: 1. basic demographic details; 2. perceptions of groups, teams and Tuckman’s model; 3. experience with groups with stable membership; and, 4. experience with teams with changing membership. Questions asked participants to focus on their personal understanding of, and experience within the call centre, of groups and teams, Tuckman’s sequential model of group development and its task and relationship ‘realms’. Interviewees were provided with the opportunity to ask the investigators any questions they had about the purpose and process of the research. All participants completed their interviews.

4. Findings and Discussion

All of the elements of technology which characterise a call centre were present at the subject facility however, their application to monitoring of individual agent performance reduced in prominence in the work routine concomitant with the progression of agents to more ‘advanced’ queues. Agents were given more latitude in their responses to ‘customers’ independent from the structured, scripted delivery to which agents employed in ‘front end’ queues were bound. Some agents particularly enjoyed the ability to ‘investigate’ the circumstances of delinquent account holders in order to trace their where-abouts to commence a resolution of the ‘customers’ debt. In this respect, agents were able to employ the call centre technology specifically to assist them in their role as ‘detective’. Agents also reported satisfaction at being able to exercise creative judgement, within limits, to negotiate options for settlement with account holders which provided a greater range of alternatives than those available to their colleagues at the ‘front end’. There appeared to be an inverse correlation between the job satisfaction of agents in more ‘advanced’ queues and the level of technology induced structure and routine in their work. Agents also reported a resultant increased opportunity to work in smaller, ‘project-based’ groups within their queue-teams leading directly to the establishment of relatively strong interpersonal bonds between those sub-group members.

Agents in these teams seemed to demonstrate the greatest departure from scientific management’s ‘one best way’ approach within the routine of the call centre by their ability to exercise individual discretion, judgement and intuition in performing their work which departed from the predetermined, scripted responses imposed on their less experienced colleagues. In doing this work, agents were encouraged to explore, (and indeed experienced higher levels success), ‘out of the box’ methods, almost the antithesis of the mechanistic procedures followed to varying degrees by agents in queues elsewhere within the outbound operation. In many call centres, workers attend to calls individually, have limited opportunities to share rostered breaks, and come together collectively for scheduled meetings only briefly. It would seem that the very nature of their work predicates against meaningful interaction which would give rise to the interdependence of team members. Interviewee 23/1, a member of a ‘front end’ team identified their work as primarily solitary in focus.
Interestingly in the outbound operation, agents’ remuneration consisted of two broad components: the first part was based on their team’s achievement of goals and performance targets (bonuses); while the second element recognised their individual efforts. The mix emphasised more individual reward as agents ‘progressed’ to the teams in queues pursuing the longer term debts however, remuneration based on team targets continued to play a significant role in the agents overall compensation package. Whether because of the team-based financial incentives, or because the interdependence and strong personal bonds formed by team members, there was substantial evidence to support the existence of mutual interdependence between members of the more ‘advanced’ queues in achieving performance targets. Members assist each other with task completion as evidenced by Interviewee 16/1 “For the conversion list that’s on my computer for the next week or so, I do my best to do my queue before the due date then we assist each other. If somebody is going to be out, we split up the work to make sure it gets done before the due date.” Further, Interviewee 16/5 reinforces the mutual decision making evident in planning and allocating tasks, “… we get together a lot to work on different sections of what we are going to do for that week.”

To explore the topic of teams within this call centre, Tuckman’s (1965) four stage, sequential model of group development was employed as the lens through which group dynamics were reviewed. The model essentially consists of four stages based on the behaviours associated with group formation (forming), conflict (storming), rule and standard setting (norming), and the achievement of synergy through member inter-dependence in task accomplishment (performing). Tuckman’s model has an enduring place as the most widely taught, intuitively appealing description of group behaviour. (Dwyer, 2005, Furst et al., 2004, Hare, 1992, McGrath et al., 2000, Robbins et al., 2005) It has been found to be relevant to contemporary call centre organisations, particularly during the initial employment training period. (Hingst, 2006b) With the addition of a temporary conforming ‘phase’, Tuckman’s model has been extended to describe the condition commonly experienced in call centres, where new members join existing teams. (Hingst, 2006a) Both of these situations were identified as present in the call centre which provided the subject for this study.

Although Tuckman never employed the term ‘team’ in his 1965 work, it is during the ultimate stage of this model that it can be argued groups have evolved into teams. Samson and Daft (2003) define teams in the following terms: ‘A team is a unit of two or more people who interact and coordinate their work to accomplish a specific goal.’ (Samson and Daft, 2003: 587) This is similar to the definition of a group provided by Wood and his colleagues ‘Formally defined in an organisational context, a group is a collection of two or more people who work with one another regularly to achieve one or more common goals.’ (Wood et al., 2004: 262) The distinction between them lies in the aspect of interdependence between the members. Samson and Daft acknowledge that all teams are groups but not all groups are teams. (Samson
In order to further explore these differences, reference can be again made to Tuckman’s model; on this occasion, to the task and interpersonal ‘realms’ of groups. Tuckman described these dimensions as the collective efforts required to perform work allocated to a group in order to achieve a goal or task completion; and, behaviours invested in establishing and maintaining interpersonal relationships which facilitate the interdependence of group members and hence, their improved potential to ‘perform’. (Tuckman, 1965, Tuckman and Jensen, 1977) Temporal and physical proximity to others seems to play a key role in the call centre environment examined here in the ability of members to develop working relationships as illustrated by this comment from Interviewee 16/5. “… these people are the ones you are going to interact with the most and so sitting with people that keep you awake, make you laugh, is a definite plus. I don’t think I could make it without them. They have the same schedule so they are there the whole time I am there.”

Interview participants strongly identified with the four stages of development Tuckman described during their initial employment training. They remarked upon deliberate strategies used by their trainers to guide training groups through the four stages of group development and noted that the strength of the interpersonal bonds formed as a consequence of these processes endured beyond training and their eventual departure upon dissolution of the group when employed on the ‘floor’ of the call centre. Of particular interest in this study was the tendency of interviewees to associate quite strongly with the members of subsequent teams as they progressed in their careers. These affiliations were most keenly felt when they were ‘promoted’ to the queue dealing with the longest outstanding debts. Interviewee 16/1 felt these bonds deeply. “I still keep in contact with my two original partners although I didn’t see them as much as my original [training] team. Any time I had a break I would go up and speak to them or go out to lunch. I was on a team with those guys and it was just like family.”

This contrasts with evidence presented elsewhere which revealed the dilution of the strength of social relationships formed subsequent to the training team experience, (Hingst, 2006a, Hingst, 2006b) although this phenomenon seemed confined to teams where the agents were able to exercise individual discretion and judgement, less constrained by scripted requirements. In these conditions, team members were also able to form sub-groups within the larger, team identity. In this respect at least, it seems that freedom from prescribed work behaviours acted as a catalyst for the creation of a more socially rewarding, less Taylorist work environment which was never-the-less, high performing in terms of both individuals and their respective teams. It also indicates that outbound call centres may not necessarily be as ‘toxic’ as their reputation might otherwise lead us to believe.

5. Conclusion

Call centres are the contemporary embodiment of the principles of scientific management. The application of technology to facilitate contact with their ‘customers’, monitor and electronically scrutinise performance, coupled with
the use of targets to focus and evaluate worker activity, have all conspired to contribute to an industry reputation for a stressful work environment. This paper presents evidence to challenge this perception. It has shown that workers in the outbound division of a large financial services call centre in the southern United States, when ‘promoted’ through progressively more challenging assignments which require routine use of discretion, judgement and intuition, are able to form relatively strong interpersonal work relationships and form teams in a meaningful sense of the term. Given the existence of contradictory nature of some of the evidence obtained from call centre research in Australia, it would seem necessary to extend study of the area of team and group development into a wider range of call centre and other organisations in the USA and elsewhere to determine whether the pursuit of the ‘one best way’ really is incompatible with teams in the workplace.
