TEACHING CULTURE AS AN INTEGRATED PART
OF LANGUAGE TEACHING:
AN INTRODUCTION

Chantal Crozet and Anthony J. Liddicoat
Australian National University

CULTURE IN LANGUAGE TEACHING

In the past language teaching has meant teaching learners four skills in the target language: speaking, listening, reading and writing. Once learners had acquired enough of these language skills, it was believed that they were ready to access the realm of culture. Culture in this sense was very narrowly perceived.

Traditionally, in language-based subjects, whether they be first or second languages, the work of teaching culture has been seen as a part of the work of teaching literature. In particular language students were expected to eventually gain an introduction into the canon of literary works valued in the particular society in which the language was spoken. This particular approach to culture starts with the materials produced by that culture and defines culture as the valued artefacts of a particular society. This view of culture was integrated into language teaching through those artefacts, such as novels, plays, poems, etc., which are created using language.

Around the beginning of the twentieth century, language teachers began to see that restricting culture to the high culture of a particular society was not the full picture which their students needed to have. In the course of the nineteenth century, the purpose of language teaching came increasingly to be viewed as involving teaching about a country and its people (Stern 1983) Literature was just a part of such an understanding. In addition to literature, people came to see that some knowledge of the history and institutions of the speakers of the language
Teaching Language, Teaching Culture

was also important as were the social psychology of the people and their contribution to civilization (Atkins and Hutton 1920; Fife 1931). Since this time, curricula have adjusted to include other elements in teaching for cultural understanding — social institutions, current events, newspapers, television, etc. In this change, have added ‘popular’ and ‘institutional’ culture to ‘high’ culture to present a wider view of culture and the ways in which culture is transmitted through language.

As research into culture and the relationship between language and culture has progressed, it has been increasingly recognized that one important aspect of culture has been omitted from the equation. This missing dimension is the cultural basis of the ways in which people communicate. Culture underlies the ways in which language is used to create texts, whether these texts are written texts, audiovisual texts or the everyday interactions of individuals — what Hymes (1974: 1986) calls ‘norms of interaction’. As (Kramsch 1993a) has pointed out, every attempt to communicate with the speaker of another language is a cultural act. What this approach is suggesting in that culture is embodied in the ways in which people interact with each other in everyday forms of talk and through the written texts they produce. That is, culture underlies every part of communication, from asking someone to lend you a pen to writing a novel. It also demonstrates quite clearly that language learners need to have access to the sorts of cultural rules which are used in the sorts of interactions in which they are likely to engage.

The shift of perception in the language/culture nexus has had many implications for the language teaching profession. Language teachers are now compelled to review the nature of the languages to be taught and also to revise their language pedagogy. Language teaching is being revisited not only in terms of content but also in terms of new types of skills learners need in order to explore culture as it is manifested in language use. Moreover, the recognition that culture pervades all aspects of language use has meant that the teaching of culture can no longer be delayed to advanced levels of language learning as was the case in the old paradigm of language instruction (Liddicoat, Crozet, Jansen and Schmidt 1997). Instead, it means that culture needs to be integrated into the teaching of all language skills so that learners can learn to speak but also write in culturally appropriate ways for a myriad of specific purposes.

Traditional and contemporary approaches to teaching culture — as briefly described above — currently co-exist in many language courses.
Chantal Crozet and Anthony J. Liddicoat

It is not our purpose in this volume to oppose the past and the new, but rather, we want to present the work in language instruction which we see as taking language pedagogy pedagogy forward into new areas. The strength of the arguments in all the papers we have selected should speak for themselves and we hope that they will give ‘food for thought’ for language teachers in their decisions about whether to stick exclusively to traditional approaches in language teaching or to venture into promising new territories.

We wish to stress that, in spite of the constant reassessment of what needs to be taught in the language classroom and how it should be taught, the basic goal of language teaching has not changed, it still is to make language learners into competent communicators in the spoken and written forms of the target language. However, as language teachers have become more and more aware of the importance of teaching culture as part of language use, redefinitions of the meaning of communicative competence have emerged.

Communicative competence is now being redefined in terms of cross-cultural understanding, intercultural and critical communicative competence (Buttjes and Byram 1990; Kramsch 1995; Tichko 1995; Zarate 1986) One of the key points to the redefinition of communicative competence for language teaching is that more than linguistic forms must be taught to language learners. The new knowledge teachers need to introduce in the language class is what Zarate (1993) has called ‘knowing how to relate to otherness’. This is the essence of intercultural competence. ‘Relating to otherness’ in turn implies that both learners’ first and target cultures be put under scrutiny in the language class so as to make visible the differences which can potentially prevent the two cultures from relating successfully. The notion of intercultural competence – as the newly defined goal of language teaching – has therefore removed the exclusive focus on native speaker norms. Instead, language teaching now needs to be seen more in the context of intercultural communication and preparing learners to communicate outside their own cultural boundaries (Bolten 1993).

This is where the biggest impact of introducing culture as part of language learning is most felt by language teachers. Teaching the target language has become teaching learners how to make their first culture relate to the target culture in a way which can free them from a monocultural view of the world without making them parrots in a new
Teaching Language, Teaching Culture

world. Descartes as early as 1637 had already articulated the kind of gain which can be derived from ‘meeting with otherness’ the first step towards what we now call intercultural competence:

"Il est bon de savoir quelque chose des moeurs de divers peuples, afin de juger des nôtres plus sainement, et que nous ne pensions pas que tout ce qui est contre nos modes soit ridicule, et contre raison, ainsi qu’ont coutume de faire ceux qui n’ont rien vu."

[It is advisable to know something of the customs of various peoples in order to better judge our own and to ensure that we do not think that anything contrary to our own practices is ridiculous and unreasonable, as do those who have never seen anything - Author’s translation]

(Descartes 1637/1972:32)

With regard to the teaching of interculturality, the professional discourse of today’s educationalists has not produced statements which are substantially different from Descartes’ advice. The problem is not the lack of a consensus about the goals of interculturality but, as always, it is the difficult task of turning ideas and theory into practice.

Language teachers are in this sense in a unique position to contribute to the making of a more intercultural world. However, the task of helping language learners challenge and re-evaluate their built-in stereotypes about other cultures in order to accept the value of another world view is not an easy nor a short term endeavour (Tickoo 1995). Intercultural sensitivity is not an automatic outcome of language learning (McMeniman and Evans 1997) In his article, Mangubhai explores the relationship between cultural factors and language attitudes and their impact on language learning. He argues that students have to be encouraged to become bicultural and adopt new patterns of behaviour in order to function in the new environment. He also argues that if cultural issues are not addressed in the classroom, the result may be dissatisfaction with the learning experience or even complete rejection of learning.

The teacher is, therefore, the principle mediator between cultures who has to consider both the learners’ own cultural expectations and understandings and at the same time introduce them to the new cultural view point enshrined in the target language. In this sense, the new educational challenges placed on language teaching are ambitious and for many language teachers they can often seem almost out of reach. Teaching language from an intercultural perspective implies teaching
culture as it is embedded in both the learner’s first language and the target language. This is arguably the easiest part of the new challenge.

One significant problem for teaching culture in the language classroom is that culture is not as readily describable as decontextualised grammatical rules. However, research in various types of discourse analysis and pragmatics has now shown that it is possible to identify the role of culture in language (see for example Blum-Kulka, House and Kasper 1989; Kerbrat-Orecchioni 1993; Moerman 1988; Wierzbicka 1986; 1991) and this work provides interesting insights which can be used in the language classroom.

The most crucial issue for language teachers is therefore not so much that culture in language is not easily accessible but that culture is primarily variable. To make culture visible is one thing to make its variable nature graspable and teachable is another. The complexity involved in this variability can be seen in the work of Boyer, Butzbach and Pendenix (1990) who distinguish three different sources of variability (which they call “diversity”) in language use - geographical, sociocultural and circumstantial - which together account for the variability of language use. The appropriateness of choice of a lexical item, gesture, etc. in an interaction can therefore depend on the geographical place, socio-economic group and particular circumstances within which the interactants are performing. Culture is not a static, monolithic construct. It is dynamic and both creates and is created by every attempt to communicate. Language teaching has tended to bypass the problem of variability in language use by often offering learners minimalist versions of the target language. While removing this difficult but essential contextual and cultural component from language might make language easier to teach, the learning outcomes which result are bound to be at the very least incomplete, and the picture of language in use which emerges will be stereotyped, inaccurate and in some cases misleading.

The cultural and linguistic variability of language use can be integrated into language courses if language teachers adopt an approach which is, as eloquently stated by Kramsch:

... an approach which is more interested in fault lines than in smooth landscapes, in the recognition of complexity and in the tolerance of ambiguity, not in the search for clear yardsticks of competence or insurances against malpractice.

(Kramsch 1993a:2)
Teaching Language, Teaching Culture

By being prepared to stand along the fault lines of language in use, the authors in this volume offer insights into how language teachers can realise the goals of intercultural competence through language teaching practice. From an enlightened perspective on the nature of language in use which integrates language and the variability of its sociocultural context – they review the teaching of traditional language skills (oral interaction, reading and writing) in both more general approaches to language teaching and also in the context of languages for specific purposes.

CULTURE IN THE SPOKEN LANGUAGE

The review of the teaching of spoken language has largely been influenced by research in discourse analysis. More specifically research in conversation analysis and pragmatics have pointed out to language teachers and researchers in Second Language Acquisition where the nexus language/culture could be found in verbal interaction. This opened up a new field of enquiry in particular in the study of learners' interlanguage pragmatics (Kasper and Schmidt 1996; Kasper and Blum-Kulka 1993). It has also led professionals in language instruction to review language teaching materials to see what has been missing in the communicative language teaching approach (Liddicoat this volume).

The relationship between discourse analysis and language teaching is now well established (Hatch 1992; Kramsch 1981; Peynard and Moirand 1992; Slade and Gardner 1986). Research in conversation analysis and pragmatics in particular both depict the socio-cultural construct within which all human verbal interaction operate. The socio-cultural construct of spoken language is made of cultural norms which are like an internal filter into which speakers feed events and ideas for interpretation (Sani 1995). Conversation analysis describes norms of interaction between speakers, that is it describes speakers' organisation of sequences in conversation (Goodwin and Heritage 1990; Heritage 1989) and it has the potential to identify what elements in this organisation are related to culture (Moerman 1988). Pragmatic norms on the other hand are more to do with the expression of speakers' intent in specific speech acts (Austin 1962; Searle 1969). Speech acts in turn refer to what people do with language, what sort of acts they perform (ie:
politeness, teasing, swearing etc...) The way a speech act is performed in any given language can be very culture specific (Wierzbicka 1985).

Although the usefulness of discourse analysis to language teaching is now unquestionable, what remains to explore is how research in discourse analysis can translate into language teaching practice. Crozet (1996) has identified seven components for the teaching of verbal interaction and culture: norms of interaction, pragmatic norms, kinesic and prosodic features, spoken grammar, colloquial lexicon and features of pronunciation. These components represent tangible new input for the teaching of spoken language. Barraja-Rohan in this volume has also redefined the nature of spoken language to be taught and offers a methodology to teach conversation as she has integrated it in a new coursebook for ESL learners. Her main points are that “conversation constitutes the base of all kinds of spoken language interaction”, it is complex and involves verbal as well as non-verbal language which is often highly culture specific. She argues that language teachers lack a theoretical framework for identifying what needs to be taught in verbal interaction and this often leads to their equating the teaching of spoken language to “making students talk”.

Barraja-Rohan also picks on an issue which is common to all articles in this volume that is she speaks of the need to expose learners to authentic spoken texts to ensure that the knowledge learners acquire in the language classroom is directly transferable to the real world. The methodology she offers has definite instructional as well as educative goals. Her work is highly innovative in that it positions every day talk as representing a form of language use which has a high cultural content and a unique socio-linguistic structure. Furthermore Barraja-Rohan clearly shows how the introduction of an intercultural perspective in the teaching of spoken language calls for a new language pedagogy.

Liddicoat in his article argues that the communicative approach to language teaching has failed in that it did not make explicit the socio-cultural construct of language use, hence it has deprived learners of the cultural rules they need to know to perform verbally in culturally appropriate ways in the target language. Liddicoat questions the cultural appropriateness of the content of language textbooks looking at two specific examples of conversation openings and closings as teaching items. Openings and closings in conversation contain ceremonial utterances which can contain a great deal of cultural variation.
Kerbrat-Orrechioni (1993) has distinguished three basic possibilities for the mapping of ceremonial utterances in a cross-cultural context.

Firstly, there may be complete congruence in the use of such utterances. One example of this may be answering the telephone. In any culture use of a telephone requires a person to pick up the telephone and establish the talk and languages have a range of forms which cover this event (see Table 1).

Table 1: Common formulae for answering the telephone

What can be seen here is that each of the languages mentioned has a common formula for opening a telephone conversation. This formulaic utterance seems to be a universal feature of telephone talk because it is a necessary pre-condition of telephone talk that a channel for communication be established (Liddicoat 1995). However, even with something as basic as this there is in fact a great deal of cultural variation in the way in which a ceremonial is realized. For example, the English utterance is the same as a greeting token, while the rest are not. Chinese weil functions as an attention-getting device – that is, a summons, much like Japanese moshimoshi. Also in some cultures, such as Japanese, it is possible for the caller to speak first rather than the answerer (Kumatoridani 1992).
We can see similar differences happening across cultures with greetings. For example, greetings are commonly realized in different ways according to the ways in which the day is divided or degrees of formality. English has a common greeting token *hello* which can be used at any time of day, while French and Italian have two different tokens *bonjour - bonsoir* and *buongiorno - buonasera* which are specified for daytime versus evening (although there are differences in when evening is deemed to begin) and Spanish *buenos días - buenas tardes* divides the day into morning and afternoon. The English equivalents have a three way division, *good morning - good afternoon - good evening*, but these are marked for a higher level of formality than their equivalents in French, Spanish and Italian. Indonesian employs a more complex pattern dividing the day into a larger number of parts: *selamat pagi* (morning), *selamat siang* (midday 11.00 am - 1.00 pm), *selamat sore* (afternoon), *selamat malam* (evening/night). Awa Pit, an indigenous language of Colombia divides greetings according to time of day and also the weather. Henriksen and Obando (1985) give nine morning greetings, including *wat kintite* (lit. it dawned well), *kwail kintite* (it dawned badly), *alukintite* (lit. it dawned raining), and four greetings for afternoon *pal nashtui* (good afternoon), *ala nashtui* (rainy afternoon), *inkwa nashtui* (windy afternoon).

In greetings and telephone openings, we can see that even very simply aspects of language in use such as greetings are highly subject to variation across languages and cultures. As such, surface similarities in functions can mask deeper differences in the ways in which interaction, at the linguistic level, and the division of time, at the conceptual level, are constructed.

Secondly, a ritual utterance may exist in one culture/language but may be unknown in the culture of the other language. In some cases this is because the event does not exist in both societies, for example greetings for specific cultural events which are not shared by the two societies. However, in many cases the actual context in which a ritual is used exists in both societies, but the context is not considered a ritual context in one of the societies.

A good example of this is the use of ceremonial utterances before eating. There is no formula used in English at the beginning of the meal, but these are very common in other languages (see Table 2).

**Table 2: Common formulae for beginning meals**

The existence of such formulae for beginning meals demonstrates an interesting aspect of meal times in the social and cultural lives of the people who use them. In Australian society, eating is considered to be a regular and necessary activity. Meals are not really occasions, although they can be made into a social event and many social events do involve eating. While a meal of course has a recognizable starting point in Australia, we do not have a ceremonial social means to mark the starting of the meal. However, in French social life food and meals have a different social and cultural value. Food and eating is central to French culture and many traditions in France value food very highly. Eating is fundamentally a social event and an event to be shared with others. As such a *bon appétit* marks the mutual beginning of the social event of eating.

If we compare the French *bon appétit* with the Singapore Hokkien Chinese *(áyl) chiba* we can also see that there are some cultural differences in the ways in which the formulae are used. In Hokkien, these before meal formulae are used with older relatives, parents of friends, friends of parents and less commonly with parents and older siblings. As such, it is typically the youngest family member who performs the formula, and effectively invites older people to begin eating first (Kuiper and Lin 1989). This rather simple ritual shows something very important about the hierarchical organization of Chinese society and the respect for age which is embodied in the society. As such a very simple ritual in a very familiar situation reveals an enormous amount about the culture which underlies the ritual.
These formulae seem also to be related to different ways of serving food at a meal. In Australia it is typical to have your meal served to you on your plate and for each person to have a plate of food. In other cultures it is more usual for food to be served communally as shared servings from which each diner helps him/herself. In this context of shared food there is obviously a social need to mark the beginning of the meal which is more important than if food is served individually. The Russian expression kusajte (na zdorovje) is usually said by the person who cooks the food, this person, however, serves the food communally but doesn’t typically eat with the rest of the people (Michael Dunn personal communication).

Thirdly, the ritual may exist in both societies but may be realized in different ways. A simple example of this can be seen in thanking behaviour. Different societies thank in different contexts and some things which may require thanks in one culture may not require thanks in another. Thanking is actually much more complex, however, than just knowing when to say ‘thank-you’. In English we tend to conceive of thanking as a single activity, however, when we compare English with a language like Japanese we can see that there is no real equivalent of English thank-you. Instead we have two types of activity, arigatoo and sumimasen, both of which resemble our notion of thanking. The sociocultural basis of these two words is quite complex. Sumimasen is actually a form of apology and in speaking Japanese it is often more appropriate to offer an apology than strictly thanking someone, particularly in response to a favour (Wierzbicka 1991).

The fourth possibility is that the ritual exists in both societies and is realized by similar formulae but these formulae do not have the same value or they are not used in the same conditions. For example, English and French both have identical formulaic expressions oh good and ah bon which can be used to acknowledge someone else’s utterance. However, while the forms of the utterances are identical the value which each form has is not identical, as can be seen in:

A: ma mère s’est cassée la jambe
B: ah bon?
A: My mother has broken her leg.
B: *oh good

In French ah bon is simply an acknowledgement which shows that you have heard what the other person said, that it is new information for
you and that you are interested. In English, the equivalent expression is an assessment — it indicates the hearer’s attitude to the information and as such it is incompatible with ‘bad news’.

The final possibility is that identical lexical forms could have a ritual function in one culture, but not in the other. We can see this quite clearly with a comparison of Australian English and French versions of the question ‘Did you have a good weekend?’ In Australian English this is a ritual question which you can ask anyone on Monday morning and it receives a ritual response such as ‘not bad’. In French, however, this question is a genuine information question which you normally only ask people you know well and if you genuinely want to know about their weekend. It usually receives a long and detailed answer and a response such as ‘not bad’ would be considered evasive or unfriendly (Béal 1992).

As we can see, even very simple language offers genuine opportunities for cultural understanding in the language classroom. In fact, it is often this very simple formulaic language which is most culturally loaded. As such, cultural knowledge is an important part of oral interaction and even very basic oral interaction is a cultural act with cultural implications.

**CULTURE IN THE WRITTEN LANGUAGE**

The written language has traditionally been seen as the repository of culture, but writing is not simply a matter of encoding cultural content into a text, it is also a culturally bound activity in terms of its goals and its execution. Reading and writing are cultural acts in just the same way that speaking and listening are. Reading and writing are therefore occasions for the learner to participate in the culture.

The effect of culture on the written language can be seen at a number of different levels. Firstly, culture can be seen in the material which is encoded in the text. Kramsch and Nolden (1994) have argued that reading in a foreign language involves “shaping the contours of the cultural gaps in meaning and relocating them if necessary” (Kramsch and Nolden 1994:34). The foreign language learner is thus placed in a position of decoding and investigating the cultural content of the text as an integral part of the activity of reading, and by implication is producing similar
behaviours in the context of foreign language writing. In fact, the cultural content of a text can make it difficult to decode, even where the language is familiar. Reading is a process where background knowledge is constantly called into play in order to understand texts and the background knowledge a reader brings to a text and the background knowledge a writer assumes that a reader brings to a text are cultural constructs.

Written texts contain powerful cultural messages and Ho (this volume) gives an interesting insight into the ways in which socialization can be carried out in conjunction with the acquisition of literacy in a first language. Ho argues that the content of instructional texts for learning to read Chinese introduces the learner to central values of Chinese culture in an essentially covert way. The decoding of text becomes the assimilation of culture. While Ho is primarily concerned with cultural transmission in learning literacy in the first language, her article also gives interesting insights into some of the complexities confronting the second language reader in trying to access these children’s texts. We can see that even simple texts are repositories of cultural ideals and practices and the language learner needs to access the cultural underpinnings of the texts as much as s/he needs to access the language which encodes them.

Ho’s Chinese learners are being socialized into practices of Chinese society through their of reading texts. For the second language reader, there is the added possibility of becoming involved in oppositional practice (Kramsch and Nolden 1994) where the values and assumptions of the first culture and the second culture can be mutually interrogated and deconstructed. Culture can be accessed through the text, but the mismatches between the incoming culture and the existing culture provide opportunities for insight and understanding.

Culture does not, however, lie only in the content of texts. It can also be seen in the form which the text takes. This idea has been a central part of contrastive rhetoric since the early work in this area (Kaplan 1966). In many discussions of the relationship between culture and writing, however, culture tends to be seen as monolithic and there is an assumption that people who are writing within a culture are encoding this monolithic culture (Kaplan 1966, Clyne 1987). Thus, French writers encode French culture, American writers encode American culture and so on. This is not, however, a useful model within which to look at texts which are produced in a cultural context because linguistic uniformity does not mean cultural
uniformity. Culture is instantiated in different ways by different individuals and different groups under the common cultural umbrella (Liddicoat 1997a). The particular features of a text can be influenced by a range of factors, including the personal preferences of the author, the expectations of the community of readers and the subject matter (Liddicoat 1997b).

The cultural variability in text structuring can be seen in a number of simple examples. In Chinese letters of request the reason for the request commonly precedes the request itself, while in English the reverse order is typical (Kirkpatrick 1993a; Kirkpatrick 1993b). Varying the order of items within a text in either language creates an effect, which in turn has consequences for the perception of the text. Thus, the Chinese order used in English appears rambling or unordered, while the English order in Chinese appears abrupt (Zhu Yunxia, personal communication).

The area of contrastive rhetoric has been a problematic one and some work in the area has been beset by culturally biased assumptions and by methodological inadequacies. Kirkpatrick (this volume) provides a set of guidelines for work in the area of contrastive rhetoric which enable the teachers (and the learners) to determine the differences in cultural practice in the construction of texts. These guidelines are important key elements for the teaching of the practice of writing culturally appropriate texts in the target language in terms of text structures.

CULTURE AND LANGUAGES FOR SPECIFIC PURPOSES

Languages for specific purposes (LSP) have not usually been considered as areas in which culture is particularly relevant. In fact, early approaches to LSP have consistently ignored elements of language which have not been seen to be directly associated with the particular discipline area under discussion (Widdowson 1983). As a result, many syllabuses for LSP have not included much beyond a narrow description of the language structures and functions involved in the discipline (Munby 1978) and many discussions of LSP have not gone much beyond identifying specialist vocabulary (Fosset and Maurand 1976; Kočourek 1981, Phal 1971). Widdowson (1983) has argued against too narrow a view of what
Chantal Crozet and Anthony J. Liddicoat

constitutes language in the LSP context, but cultural dimensions have still not been emphasized to a large degree.

LSP is, however, highly culturally contexsted, both within the culture of the discipline itself and also in the more general culture of the speech community (Liddicoat 1997b). The papers by Schmidt and Hanna and Cowley have each addressed the issue of the place of culture in LSP. Schmidt indicates the sorts of cultural knowledge needed by qualified nurses receiving language training in Germany and argues that the hospital is not a culturally neutral environment, but rather that nurses need information about German hospital culture in order to be able to function effectively in this environment. Hanna and Crowley emphasize the problematic nature of the multiple levels of culture in action in a French for Business classroom, indicating that aspects of the target language culture, of the business culture and of the classroom culture are all present and potentially competing.

These chapters indicate the desirability of further investigation of the role of culture in LSP and interactions between culture and language within all language teaching contexts. They make the point clearly that there is no language use without culture and that culture is central to communication. They also open a new dimension which involves the interaction of a professional culture and a general culture, both of which may be unfamiliar to the language learner. This unfamiliarity with the professional culture may stem from either a lack of prior exposure to the professional culture, as seems to be the case with Cowley and Hanna's business students, or from different understandings of the professional culture in different societies, as in the case of Schmidt's nurses. These studies both point to the multiple complexities of language and culture involved in professional contexts and challenge the more decontextualized approaches to language teaching sometimes used for teaching languages for professional purposes.

CONCLUSION

The picture which emerges strongly in this volume is that culture is fundamental in all aspects of language use and as such it merits centrality in all aspects of language teaching. Therefore, as language teachers we
Teaching Language, Teaching Culture

must acknowledge the inextricable link between language and culture in the language classroom. It is impossible to use language without creating a context and without creating social relationships through the use of language. Cultural understandings are, therefore, the basic underpinnings of communication. Even in situations where a language is used as a lingua franca between non-native speakers, these speakers are engaged in developing a social context in which cultural values are being enacted. Wherever a language is used by non-native speakers, speakers are involved in intercultural contexts and require strategies for interpreting culture and language as they communicate. As such, cultural issues can never be relegated to the position of an additional component in language teaching, but must be acknowledged in any language teaching activity.

Secondly, culture is found in the more interactional levels of language where speakers create relationships and social contexts through language, as well as at the higher levels of texts. Culture is the basis of both the micro-level organization of language and society and the macro-level. Culture does not simply determine what information is conveyed but also how information is conveyed and how it is accepted, rejected or otherwise acted on. In fact, it is the micro-level of social interaction which functions to create the macro-level, and social structures can be seen as being built from the sum total of interactions between the members of a social group (Schegloff 1987). The socially constructed nature of the world can, therefore, be seen to be created through socially constructed moments of interaction.

By exposing the learner to new possibilities for understanding the socially constructed nature of the world, the learning of a new language offers opportunities to learn about one’s own culture as well as learning about the target culture. One’s own cultural assumptions tend to be invisible and unanalysed (Liddicoat, Crozet, Jansen and Schmidt 1997). The first steps towards understanding a new culture must be to acknowledge that culture is relative and to begin to understand how one’s own culture affects one’s thoughts, actions and words. It is through a process of intertextual comparison between cultures that new cultures can be grasped and understood, but through the same processes one’s own culture is thrown more clearly into relief and is made available for analysis (Kramsch 1993a, 1993b, Kramsch and Nolden 1994).
In order to be able to come to terms with a new culture, learners need a metaknowledge — a discourse about culture — which can be used to describe and reflect on events. When learners can reflect on cultural differences, they have the potential to guide their own learning and to continue their learning independently of classroom and teachers (Byram and Zarate 1994). Given the volume of cultural knowledge which the learner is likely to require in communicating with native speakers and the dynamism inherent in culture itself, it is impossible for the language teacher to teach it all. Consequently, it is vital that learners have strategies which they can apply to further their own learning and to interpret cultural acts in the context in which they occur, not just some information about target language cultural practices. Culture, therefore, needs to be taught as a process, which is subject to change, as a static artefact of some particular social group.

As such, it needs to be acknowledged that culture has to be taught explicitly, it is not simply assimilated by learners (Kramsch 1993b). This is especially the case in foreign language contexts where learners do not have access to a native speaker community. Culture can only be acquired once attention has been drawn to cultural differences. Without some form of culture teaching, it is possible that this may never happen. Insight into culture needs to be developed, it cannot be assumed. It is too late to wait until the learner gains a high level of proficiency or visits a country where the language is spoken. A learner who knows some of the language but none of the culture risks being fluent but socially incompetent in any attempt to communicate with native speakers. Students need to know how to use the language for communication, not just how to produce acceptable sentences in the language. In addition, useful cultural knowledge is not a set of descriptive facts about the ways in which native speakers behave, it needs to be experienced and practised before it can be deployed.

In all this, it needs to be remembered that the focus of culture teaching needs to be on creating an intercultural space for the learner. The appropriate norm is, therefore, not the native speaker, but rather is a bilingual position. Every individual has a personality, a self-image and an identity which have been developed in their first language context and these need to be respected and accepted in language learning. The learner cannot be expected to abandon or deny the self in order to embrace the other. The aim of language teaching is not to assimilate the learner into
the native-speaker community, but rather to encourage them to adopt a position in which they are comfortable in dealing with native speakers and are able to achieve their personal and communicative goals.

Once the need to teach culture as an integrated part of language use has been acknowledged at the level of theory as a central aspect of language teaching, there are important consequences for practice. The following factors appear to us to be the most important:

1. Culture has to be integrated into the language classroom from the very first day of language learning. We do not wish to emphasize just the early start to culture learning, but also its integration. Culture must be taught in conjunction with language, not as an adjunct. Along with Kramsch (1991) we are not arguing for culture teaching alongside language teaching but culture teaching which is indistinguishable from language teaching.

2. There is a need to develop new materials for language teaching. It is most important to produce materials which enable the learner to gain exposure to the target culture and to have opportunities to reflect on her/his own culture. Many foreign language textbooks have adopted a perspective which emphasizes the culture of the learner over that of the target community (Kramsch 1987) and these textbooks are actually an impediment to the integration of language and culture.

3. There is a need to bring a cross-cultural perspective into the teaching of what has been, and still is, adjunct cultural content, such as literature. Approaches which focus solely on the literary merits or historical importance of texts miss opportunities to introduce learners to more significant cultural issues. Kramsch and Nolden (1994), using the concept of oppositional practice, introduce an approach which allows texts to function in a multidimensional way in order to enrich the overall experience of language learning and expand the horizons of second language literacy.

4. There is also a need for teacher training to integrate cultural perspectives into language pedagogy as a basic part of language teaching method. The integration of culture into the language
curriculum means a rethinking of the whole process of language teaching. We can no more expect teachers to assimilate this than we can expect learners to assimilate culture.

5. There is a need for more research which describes the ways in which language is used in different cultures. This research is vital to support language teachers. Many teachers who are not native speakers have had little exposure to the cultures of the languages they are teaching and may be unaware of even quite critical differences between their students' first culture and the target culture. Similarly, many native-speaker teachers have not had to analyze their own cultures to the extent necessary for them to know what non-native speakers may need to learn. This is an area in which intuitions are not always adequate or correct.

6. There is also a need for research which will help us to understand how a second culture is acquired and how an intercultural space is created by learners. These elements have been typically neglected in second language acquisition.

Seeing culture as integrated at all levels of language is a new paradigm in language teaching (Liddicoat, Crozet, Jansen and Schmidt 1997) and is currently far from being the dominant view professed by language teachers. However, this paradigm is gaining impetus as the internationalization and globalization of communication make their impact on the ways in which foreign language use is perceived. The paradigm shift which language teaching currently faces promises to be as wide ranging as was the shift to communicative language teaching. Moving towards an intercultural approach in language teaching fulfills one of the higher potentials of education – to expand the learner's horizons and to prepare them to participate in a multilingual and multicultural world.

Teaching Language, Teaching Culture

INTRODUCTION

Our attitude towards what we listen to is determined by our habits. We expect things to be said in the way in which we are accustomed to talk ourselves: things that are said some other way do not seem the same at all but seem rather incomprehensible... thus, one needs already to be have been educated in the way to approach each subject.

This paper explores the relationships between certain cultural factors related to language use, and attitudes at both micro (classroom) and macro (society) levels and their possible impact upon ESL learning. Although the primary focus is on ESL learning, the discussion of attitudes at the macrolevel inevitably encompasses academic learning generally. Pedagogical implications will be exemplified with cases of successful incorporation of the understandings and behaviours that learners bring with them to classroom programs and practices. It will also describe how these understandings can be put into effect in the provision of programs that enhance students' chances of academic success. A research agenda is also suggested in order to answer questions of the type that Riley (1988:29) has posed, whether "[cultural variation] is ... important enough to merit taking consideration, or should we bypass it and go straight on to individual variation?"

The difficulties in discussing cultural factors in ESL learning and attitudes globally are that statements relevant in one or more contexts of learning may not be relevant in some other contexts. It is generally believed that most children learning a second language have not developed an attitude — positive or negative — toward the target language (TL) or the TL people (Macnamara 1973, Genesee and Hamayan 1980), but the converse is generally true for older learners, especially at the beginning stages of second language learning (Larsen-Freeman and Long 1991). It must also be acknowledged that within any one cultural group there is variation in behaviour, including learning behaviour. Nonetheless, it is possible to discern certain patterns of behaviour, or primary tendencies, within a cultural or sub-cultural group that permit one to address learners as a group, a point also emphasised by Bennett (1995). This is sometimes regarded as 'stereotyping' and an argument may be dismissed by invoking this word. Behaviours of a particular group of people need to be viewed as a set of data that indicates a primary tendency, the hump on a curve, if you will, with lots of variation on either side of it.

There are many factors that impinge upon second language learning (see, for example, Schumann 1978, Stern 1983, Gardner 1988, Spolsky 1989). This paper looks at the social context of learning but within that context limits itself to cultural factors and the power relationships that exist in any one social group (microlevel) and the power relationships that exist between a group and another group, usually more dominant (the macrolevel). The discussion of cultural factors in ESL learning focuses
on "language use", that is, the way a group uses language to enact social relationships, to enter into exchanges, and to construct reality. Primary socialization enculturates members of a particular group into language use so that some uses and some attitudes to types of language are more salient in their everyday life. This paper will consider how language is used in writing, ways in which texts are used as well as what constitutes legitimate reading in a culture, and the ways in which oral interactions are structured and the purposes they achieve. It reviews research that suggests that these diverse functions of language are dependent upon the investment of legitimacy conferred upon them by the society.

The discussion on attitudes will dwell upon actions that people take in their lives, either at the level of specific interactions in particular contexts (e.g. in classrooms or other contexts of learning - microlevel), or at a more macrolevel where attitudes towards institutions and curricula are made manifest. Both types of attitudes may be moderated by learner personality and background factors and these may account for attitudinal variation within any socially defined group, but these latter factors will not be discussed.

CULTURAL FACTORS

Writing

The influence of cultural thought patterns upon writing, especially in academic contexts, was suggested by Kaplan as far back as 1966. He claimed that students from cultures where the rhetorical features of expository writing were different from those used in English academic writing had to learn the English patterns if they were to successfully communicate with their professors in English-speaking academic institutions. While his ideas have been questioned since then (see, for example, Mohan and Lo 1985) and his more recent writings (Kaplan 1987) have emphasised the complexity of issues involved, his work, nevertheless, has drawn the attention of teachers to the transition that second language learners have to effect if they are to be successful within the norms and requirements of English-speaking academic institutions (something that some native speakers also have to learn in order to be successful in academic contexts. Recently, the work of Hinkel (1994) has showed that L1 rhetorical approaches to writing in ESL may still influence writers despite many years of ESL composition instruction.
Teaching Language, Teaching Culture

The hurdle for second language learners in western academic contexts does not, however, simply consist of adopting a new rhetorical pattern of writing, but also involves the adoption of an almost new way of thinking, approaching knowledge, and new understandings of the types of evidence that lend legitimacy to that knowledge. Ballard and Clanchy (1988), for example, discuss the case of a graduate Japanese student who had written an essay comparing the ideas of two economists, Friedman and Samuelson. In his writing he talked about the different backgrounds of these two economists and generally tried to explain why two authorities on economics might come to such different conclusions. An interview with the student showed that the student could not not bring himself to criticise the ideas of these two renowned writers. He therefore attempted what he considered a more appropriate solution to the task, and tried to justify their views through an evaluation of their backgrounds and experiences that might have led them to their conclusions. For the student both views were legitimate, but the assignment required that he take a stand and argue for one writer’s position over the other’s or highlight the relative merits and weaknesses of both writers, a requirement that went against the grain of his primary socialization.

Rhetorical styles of writing of a society reflect the values and the ways in which ideas and interactions are perceived in that society and the goals that are achieved through them (Clancy 1990). In some cultures, direct criticism is regarded as contributing to disharmony and where harmony in the society is highly valued many things remain unsaid or are left at the level of implications which can be denied if they are contested. The academia in the English-speaking world, on the other hand, values authentic voice, self-expression, stylistic innovation, a directness in academic texts which stresses a clear formulation of a case, a stance, and the citation of evidence to prove one’s case (Matalene 1985). The primary responsibility for conveying the information and arguments lies with the writer and therefore a high degree of explicitness is required.

Hinds (1987) has argued that while classical writing in Japanese was indeed “reader responsible”, modern writing has become more “writer responsible”. Mohan and Lo (1985) make similar claims after analyzing classical and modern Chinese writing: the trend is towards more directness, particularly it seems, by those who has studied in an English-speaking environment. However, Xia Wang (1994), who examined some Chinese writing instruction booklets, found that the
pedagogical presentation of writing emphasised implicitness in the introduction and conclusion, and the exploration of the theme from multiple perspectives: comprehension was the readers’ responsibility. Matalene (1985) has argued that Chinese writing incorporates a lot of proverbs, maxims and pieces of folklore and that ‘invention’ for the Chinese generally means doing it the way it has been done before. It would seem, therefore, that in countries like China and Japan there are trends in formal writing towards making it more writer responsible. In the case of the former, however, it appears that instructional practices at school level may not have caught up with this trend yet, as suggested by the work of Xia Wang (1994).

The difficulties that some ESL learners encounter may be not so much due to the way writing is structured in their society per se but may lie in the more deep-seated values regarding attitudes to ideas and writers (particularly ‘experts’) that are internalised as part of the primary socialization. The Japanese student mentioned above is a case in point. He could not bring himself to be critical of writers who were regarded as experts in their field. Teachers of English for Academic Purposes and university professors remark upon ESL learners’ inability (or unwillingness) to read texts critically (Allan 1996). Such social values are resistant to easy change and a change in one value may affect a complex of values. For example, it may be that being critical of experts may also be related to attitudes towards older people in one’s culture, so that a change in one area may also have ramifications for another. Frequently the difficulties in the production of academic writing by ESL learners are discussed in terms of expert and novice abilities (Zamel 1982, Richards 1990) but do not touch upon cultural patterns of thinking and behaviour that underpin ways that ESL learners write. When changes are demanded by changing circumstances or new contexts, the process is a difficult, and often a painful one, as the writer’s own ESL learning attests. Canagarajah (1993), for example, shows how Tamil learners of English experienced a “tension or discomfort in the confrontation between the discourse they preferred and the discourses informing the ESOL course” (Canagarajah 1993:621).

Classroom activities which are aimed at the ‘surface’ level of organisation of academic texts may not be successful because the underlying social practices in L1 writing are not addressed, or contrasts between the two processes are not made sufficiently explicit. Students, in effect, have
to be encouraged to become bicultural and adopt new patterns of behaviour in order to operate successfully in the new environment, and ways of doing this in the classroom have to be addressed.

Reading

The literature on reading discusses a number of studies that show that the background knowledge of readers has an influence upon the comprehension and retention of a written text and the type of elaborations that are made by readers as they construct a model of the text (e.g. Steffensen, Joag-Dev and Anderson 1979, Pritchard 1990). There has been a considerable amount of discussion on background knowledge (the schema theory) in relation to first language reading (Adams and Collins 1979, Rumelhart 1980, Anderson 1984) as well as second (e.g. Carrell 1983, 1987, Carrell and Eisterhold 1983, Prahlad 1993). This paper will not dwell upon these studies. Instead, it looks at ways in which learners from different social backgrounds approach text. In many cultures the written word, especially if it is written by an 'expert', is accepted uncritically because of the respect and high regard that is accorded to such writers (Osterloh 1980, Maley 1983, Ozog 1987, Kwan-Terry 1994). In Islamic countries Koranic reading does not encourage the questioning of the text because it is accepted as the divine word, "entirely mature, accomplished, and unalterable" (Osterloh 1980:58). Authority is conferred upon a text by the status of the author and readers do not form their own personal opinion but use the "collective opinions that dominated [their] previous social experience" (Osterloh 1980:80). This type of attitude is further reinforced in those educational systems where reading texts is an exercise in extracting the ideas of the writer but not necessarily evaluating them critically (see, for example, Kwan-Terry 1994). A number of texts may be read in which different ideas are discussed, sometimes at variance with one another, and readers try to reconcile or accept them as different ways of approaching a topic because of differences in the writers' experiences (as in the example of the Japanese student given previously).

The comprehension of a text involves a process of construction that draws upon the prior knowledge of the reader, as well as the interaction of a number of component skills (Grabe 1991). But it is also a selective process in that readers focus upon elements of the text that are socially most salient to them, as Pritchard (1990) shows. In his study, proficient
American and Palauan readers at college level read two texts on funeral arrangements. One text dealt with typical Anglo-American funeral arrangements, the other with Palauan. He found that the Palauan readers tried to relate the unfamiliar text to the type of personalised information they considered foremost. Given below are three examples from the think-aloud protocols of the Palauan subjects.

1. Either her mother or father wrote a letter to her.
2. When did they come ... contact her? Was it her mother’s father or her father’s father?
3. On Monday they were very busy so maybe ... they couldn’t tell her or call her ... so she couldn’t ... make it or she was just so far away.

(Pritchard 1990:287)

These examples show that the Palauan students, like other readers, relate what is read to their background knowledge. For Palauan readers this means focusing on the relationships of the people involved in the letters, thus highlighting that reading is driven by what is socially most salient in this Pacific society, the relationships between people and the types of behaviours resulting from them.

The social practices of a group also influence what is read by that group. The texts that are read, in a sense, are socially approved. Heath (1983), for example, discusses the type of reading (religious and non-fiction) that the Rockville parents considered appropriate and valid. Mangubhai (1986a, 1987), writing about literacy in the South Pacific, discusses the type of reading that is approved in Fijian society – the reading of the Bible and other religious writings. A literacy event such as a young Fijian person in a village sitting down to read stories for leisure would be regarded as evidence of laziness and avoidance of work that needs to be done either in the plantation for boys or in the house for girls. Reading practices are socially situated in terms of both the meanings that are normally constructed from them and what counts as legitimate reading (see also Kulick and Stroud 1993).

The practices of writing and reading are, however, not universal and were even less so a mere two hundred years ago. There are still languages in the world for which there are no orthographies. Where such languages are given an orthography it has been suggested that the functions that writing performs initially in these language groups mirrors the functions that are enacted through oral speech (Kulick and Stroud
The following section discusses the oral use of language and looks at some cultural practices that underpin such use.

**INTERACTIONAL FEATURES**

In the study of oral interactions, and particularly pragmatic considerations in such interactions, considerable work has been carried out showing misunderstandings in communication arising from different value systems and perceptions about the topics (e.g. Kasper 1989, 1992, Richards and Sukwiwat 1982), misunderstandings arising from the use of L1 intonational patterns in L2 (e.g. Gumperz 1982, Mishra 1982), and those arising from using L1 thematic structure in L2 (Gumperz, Aulakh and Kaltman 1982). Gumperz (1982), for example, discusses the perception of native English speakers of an East Asian woman serving food in a cafeteria as rude because she asks customers if they wanted gravy with a falling rather than rising intonation – an element in her L1 which had no feature of impoliteness attached to it.

Other studies have gone beyond the language involved in interactions to ways in which oral interactions are structured in a society (Young 1982, Scollon and Scollon 1981, Scollon 1991). Scollon and Scollon (1981), who studied the Athabascan Indians in Canada, found that their conversation practices, including their use of a greater pause before speaking, led the American English speakers to perceive the Athabascans as silent, withdrawn and somewhat hostile, while the Athabascans perceived the Americans as rude, pushy and aggressive. In an interactive context the Americans felt they had to talk because the Athabascans would not say anything. The Athabascans, on the other hand, felt that they were never given an opportunity to speak.¹ (These should properly be regarded as propensities within an American sub-culture because of the multicultural composition of the American population and, as Tannen (1984) shows, even within a subculture, there are differences in speaking styles between males and females.)

Scollon and Scollon (1991) also discuss another aspect of conversation suggested by Scheglof (1972): that the person who begins an exchange has the right to introduce the topic. Such an exchange may begin by the ring of a telephone or the doorbell, or someone putting their head into one's room and saying something like 'Hi Razika' or 'Excuse
me, John', or by calling out for someone across the road. In each case it is the person who initiates the conversational exchange who introduces the topic of conversation. It would be a very odd exchange if the person who is being called to a conversation were to begin to talk about, for example, his or her plans for the coming summer holiday. The expected behaviour is some form of a conventional response, like 'hello' on the phone or a simple 'yes' or a body signal that acknowledges that the call has been heeded.

Using this framework, Scollon and Scollon (1991) find that Chinese 'callers' frequently do not introduce the topic immediately so a speaker from an English-speaking background is puzzled about the point of the whole conversation. They suggest the pattern for Chinese speakers is not 'call-answer-introduce the topic' but 'call-answer-facework' and in some cases an optional topic. The topic is optional especially when favours are being sought, and the supposedly idle chatter is part of 'facework' which allows the initiator to assess the situation for the likely success of the proposed request. Where it is judged that there is a high chance of success in getting what he or she wants, the real topic of the conversation is introduced: where it is judged that the chances of success are very low, then the topic is avoided and thus there is a saving of face, both on the part of the initiator and on the part of the second interactant who now does not have to say 'no' to a request, a point also made by a subject in Young (1982).

The 'facework' portion of a conversational exchange has ramifications for cross-cultural communication, for it is quite likely that a Chinese speaker would not expect his caller to begin immediately with the topic and may therefore pay somewhat less attention to it. Scollon and Scollon (1991) conclude that the consequence of such a difference in expectation is that "both conversationists may remember exactly the same details from a conversation, but each will ascribe quite different values to the items. This, we think, is the basis of the perennial uneasiness both Asians and Westerners feel in their mutual conversations" (Scollon and Scollon 1991:116-117). This is a rather broad generalization, but one that is worthy of further investigation.

Facework is an element not just in Chinese conversational structure. It is also found in the writer's own culture (Gujarati) as in the example below.
Teaching Language, Teaching Culture

[At a wedding reception, organised by the bride’s family, where guests are seated in rows and served food. The bride’s parents or relatives take special care to see that the immediate family and close relatives of the bridegroom are fed well. B represents a person from the bride’s side and G from groom’s.]

B: Have some more food.
G: No, no. I am full. I have eaten too much.
B: You haven’t eaten very much. Have some more (laddling some food, which is countered by B putting his hands over the plate so that food cannot be put onto it).
G: No, no, I have had enough.
B: Only a little.
G: No, no ... (hands moving away from the plate slowly).
B: I’ll just give you a little bit.
G: No, no, I have eaten too much (by now hands have moved away from the plate to its side, thus opening up a space for B to give G some more food).
B: There, I’ll only put a little on your plate (laddling some food onto the plate).
G: OK, only because you insist.

(Personal observations)

Quite a complex ritual has been enacted in this exchange, with underlying meanings not evident in the actual words used in the moves. For G to have accepted more food as soon as it was offered would have diminished him in the eyes of B, as being a ‘khaadro’ – a gluttonous person, but the Gujarati word is more pejorative. For B not to have insisted that G have more food would have diminished him in the eyes of G (and G’s party). This would be interpreted that the bride’s side was being mean in not providing enough food and making sure that guests were fed well. The ritual that is enacted leaves both parties satisfied, with no loss of face.

The notion of face operates a little differently in the case of Nigerians (Igbo) according to Nwoye (1992). He argues that prevention of loss of face for the group – defined as “any social unit larger than the individual, it is constituted concentrically by the nuclear family, the extended family, the clan, the village, the town, and the ethnic group on expanding order” (Nwoye 1992:315) – takes precedence over loss of face for an individual, underscoring the fact that in some communities the group has precedence over the individual or the immediate family.

The discussion above might suggest that face work is not a feature of Anglo-Celtic societies. This is not so. The critical difference, however,
is that many Asian societies are what is termed 'high-face' societies, where loss of face is felt very keenly and has greater social ramifications (see Hofstede 1986).

The degree of explicitness and control in talk may vary from culture to culture also. Yokota (1994) studied videotapes of Japanese politicians discussing an issue on television and found that question forms which led to 'Yes/No' response were rarely used because such questions reflect a strong degree of turn and topic control. The more common phenomenon was the usage of tag-like constructions which are weak in both turn and topic control. Similarly, in discussing an aspect of Nigerian oral interaction pattern, Bennett (1995) claims that explicit speech is directed towards children and that adult talk is more indirect, with speakers giving each other sufficiently detailed information for the listener to infer what is intended. To talk directly to an adult Nigerian is to treat the person like a child. The degree of implicitness in some cultures is summed up by Hoshikawa for Japanese thus:

What is often verbally expressed and what is actually intended are two different things. What is verbally expressed is probably important enough to maintain friendship, and it is generally called *tatemae* which means simply 'in principle' but what is not verbalised counts most – *honme* which means 'true mind'. Although it is not expressed verbally, you are supposed to know it by *kan* – 'intuition'.

(Hoshikawa 1978: 228-229, cited in Hinds 1987:144)

Another aspect of oral interactions that has a bearing on the development of interactions is the relative statuses of the participants. Beebe, Takahashi and Uliss-Weltz (1990) found that Japanese speakers of English in the USA included or excluded expressions of apology or regret in refusing invitations depending upon the status of the person who had invited them. This was in contrast to the dominant Anglo-American structure which was guided by the degree of familiarity with the person making the invitation. Similarly, age is an important factor in many cultures, frequently determining the order of speakers (Scollon and Wong-Scollon 1991).

A feature of oral interactions that reflects a different sociocultural orientation from that in mainstream English-speaking societies is the different ways verbal information is sought. Eades (1993) discusses the way Aboriginal speakers of English use direct questions to seek
“orientation information”, such as clarification of topic, background details about people, time, place and setting, generally in the form of a statement with a rising intonation at the end. Where substantial information is sought, such as important personal details or reasons, questions are not used. Instead the person seeking information presents the information he or she has and then becomes silent, with the expectation that the interactant will supply further information on the topic introduced. These modes of verbal behaviour reflect the socially constructed and approved modes of behaviour.

The patterns of oral interactions discussed above are not simply exchanges about goods and services, to use Halliday’s (1985) terms, but at a cultural level conform to certain expected behaviours, the non-fulfilment of which can result in social disapproval. Interactions in many cultures do not develop according to the Gricean principles of cooperation and the maxims of sincerity, clarity and quantity (see also, Riley 1988, Harris 1995) because other more powerful social values such as face, harmonious relationships, age and status may intervene.

The next section discusses how attitudes of learners can have an impact upon second language learning, and in some cases on learning in school contexts generally.

**ATTITUDES I: MICROLEVEL**

Attitudes can operate at the level at which learning activities are organised (microlevel) or at the level of society (macrolevel). Attitudes at macrolevel can lead to a rejection of both the content and processes of learning. While there has been much discussion in the literature about attitudes (e.g., Gardner and Lambert 1972, Ollier, Hudson and Liu 1977, Gardner 1985, Spolsky 1989), this paper does not dwell upon matters such as learners’ attitudes to the TL, the TL speakers, the target language culture, or the social value of language (see Tollefson 1991 and Fairclough 1989 for a critical discussion of some of these issues). Instead, it looks at attitudes at the level of learning itself, at a microlevel. Such attitudes include, for example, the attitude to the teacher as an authority figure, the attitude to text, criticism of others’ ideas, belief about how a second language is learned, and so on. Without going into the social psychology of attitude, a number of general observations about attitudes need to be made (see Ellis 1994). Attitudes are both cognitive (one can
think about them) and affective (have feelings and emotions attached to
them). They are on a continuum rather than representing a dichotomy,
that is, attitudes about things can be more or less favourable. Attitudes
are formed as part of one’s socialization and they are persistent though
they may be subject to modification through subsequent experience. The
point that needs emphasis is that these attitudes are shaped by actions and
events experienced as one grows up in a particular culture and have an
impact upon the cognitive functioning of an individual, a point
emphasised by Geertz.

The accepted view that mental functioning is essentially an
intracerebral process, which can only be secondarily assisted or
amplified by the various artificial devices which the process has
enabled man to invent, appears to be quite wrong.... Rather than
culture acting only to supplement, develop and extend organically
based capacities logically and genetically prior to it, it would seem
to be ingredient to those capacities themselves. A cultureless human
being would probably turn out to be not an intrinsically talented
though unfulfilled ape, but a wholly mindless and consequently
unworkable monstrosity.

(Geertz 1973:76, 78)

These attitudes may be of varying strengths depending upon the
precise experiences in our lives that have shaped them. In a survey of
parental attitudes to the teaching of foreign languages, particularly
recently introduced Asian languages like Chinese, Japanese and
Indonesian, carried out some years ago in the state of Queensland in
Australia, there were quite lengthy comments from a few parents who
could not see why the State was making Japanese one of the priority
foreign languages (Postle and Mangubhai 1991). They wrote at length
about the role of the Japanese in the second world war. There was no way
of exploring further whether these parents were themselves involved in
fighting during the war or had lost members of their family, but it seems
that the very strong feelings expressed about the teaching of the Japanese
language suggest that their personal experience, directly or indirectly, of
the war would have shaped their attitudes towards the Japanese and their
language.

Another attitude that ESL/EFL learners may bring to their
classroom, both in a context where English is spoken as a native tongue
and where it is learned as a foreign language, is the high regard in which
teachers are held (Ting 1987, Kwan-Terry 1994), the socially grounded
inability of students to question them, and the reverential attitude towards the printed word. Such ESL learners come from cultures where teachers are held in high regard because traditionally they were the repositories of knowledge. In the Indian tradition, for example, a young man who sought knowledge – and traditionally it was knowledge of religious type – would seek a ‘guru’ or teacher to whom he would listen, and would be directed by him. The Hindi word to describe the ‘learner’ is chelaa which more properly translates as ‘disciple’ rather than learner. The relationship between the guru and the chelaa is asymmetrical and it is acknowledged overtly as such by both parties. It has been socially constituted and thus, in a sense, approved, and has been recreated in each generation right up to the present. Children growing up within such a culture have abstracted from the multiple instances of teacher-learner events (reinforced by parents) a set of attitudes which determine their behaviour in that particular context. They are resistant to easy change and early changes in behaviour can be marked by some discomfort and an acute awareness of the new type of behaviour. That some school systems and teachers encourage students to disagree with the teacher (with reasons) in certain contexts can be both a surprise and cause an initial negative evaluation of the teacher who encourages such behaviour, as shown in this exchange taken from Kumaravadivelu (1991:105-106):

S3: This is ...
S4: Large
S3: Big size
T2: Too big? Too large? Oh, some thing ...
S3: Big for her ... and uh ...
S4: The price ...
S3: A little costly ...
T2: Too expensive
S4: No ... not ... a little costly
T2: OK, so you won’t choose that because it is too expensive ...
S3: I think it’s costly.
T2: Yeah, in English we say too expensive.
S3: I can’t say costly?
T2: Well, ... (a long pause) Costly is OK, yeah, but more often ... probably we say expensive..
S3: OK, you are my teacher ... (laughs)
T2: No, you don’t have to agree with me ...
S3: I don’t have to?

Kumaravadivelu says that there is an “almost derisive response with a sense of surprise”.
Attitudes at the microlevel do undergo a change, the rate and extent of which is dependent upon whether the second language learners are in a migrant context or in a context of 'short-stay'. Laaksonen (1994) found that while international students (short-stay) take part in peer assessment under the guidance of the teachers, they are initially very reluctant to do this. Using semi-structured interview techniques she collected data that show that some of the students are willing to try out newer approaches to their learning in the new context, but they state that they would revert to previous ways when they returned to their own countries. Given below is a reason by a Laotian student why he was willing to try peer assessment in the context of learning ESL in Australia.

If you express your weak points and somebody knows your weak points then they dislike you ... when I was in our country, I was a bit shy, even though I couldn’t or didn’t want to express my strengths or weaknesses to my friends or to my parents, but here I think more or less I can express or show other people my weakness or strengths. (Laotian student [F2] male)

(Laaksonen 1994:220)

In a social context where the effects of self-revelation are minimised and, in a sense, localised, this student is willing to allow other students to make judgements about the strengths or weaknesses of his writing, but such behaviour back home would, he considers, exact too great a price in terms of his or her standing in the community.

In the same study, other students from Indonesia indicated that they adopted as many of the behaviours suggested by their teachers as they considered might be necessary to achieve their goal of acquiring a qualification from an Australian university but were aware that they would need to go back to their own society and operate according to its norms for them to be successful.

These examples suggest that attitudes at microlevel can undergo a change if the context of learning is conducive to such changes. The teachers need to provide an environment in which learners are willing to undertake newer behaviours, which in some cases, as described above, may go against the behaviours shaped by primary socialization. It is the sensitivity of the teachers to such potential mismatches between the students’ prior learning experiences and their current ones that may lead to a classroom milieu which facilitates the transition that the students may have to make (and in some cases the teacher also).
ATTITUDES 2: MACROLEVEL.

We all live in many different 'worlds': the world of our own household, the world of work, the church, sports clubs, women's clubs and so on. Gee (1990) refers to this as participating in different discourses in different settings. The world of the formal school system is a literate world in which full participation requires one to be initiated into particular literate behaviours that "instill problem-solving abilities and knowledge-creating resources" (Heath 1987: vii) and lies at the other end of the literacy continuum from that which promotes only basic reading and writing. Schooling requires students to participate in complex forms of academic literacy even though their occurrence may not be widespread in all the communities in which the institutions are set. The sociocultural context of school can be very different from the one they inhabit outside school, with different values and different ways of interacting. In some cases there might be minimal intersection between the two.

For many migrants, especially those who have moved from a less industrialised to a highly industrialised country, the change that is expected to be made is a very marked one and can be very bewildering if the social practices in the two countries are very different. To participate fully in the new environment immigrants have to develop another set of attitudes and values. Depending upon the age of the immigrants at the time of arrival in the new country, the new set of values and attitudes is developed to varying degrees, with some older migrants adopting only those aspects that enable them to operate in the workplace and carry out their daily social needs outside the home and their particular social group.

For many children of migrants the first sustained contact with new values and attitudes occurs when they enter the formal school system, which generally reflects the values and attitudes of the dominant members of that society.

Some migrant groups learn to make changes in their behaviours so that they can take advantage of the perceived benefits that the new country offers them, without feeling that their cultural identity is being threatened. Ogbug (1991), for example, says that some

minority children do well in school even though they do not share the language and cultural backgrounds of the dominant group that are reflected in the curriculum contents, instructional style and other practices of the schools.

(Ogbug 1991:29)
He cites examples of Punjabi and other East Asian students' relatively strong academic achievement in British and Californian school systems resulting from the adoption of a strategy of "accommodating" to a new environment without becoming "assimilated" into it. In other words, they learn to operate in two worlds, the world in which they have been socialised and the new world into which the initiation for non-adults is through the formal school system. In most cases, both worlds are supported by the parents of immigrant children because the second world is seen as an entry into prosperity.

Other groups which have been colonised and are a minority in their own country, as in the case of the Aboriginals in Australia and the Indians in the USA and Canada, do not perform as well in the dominant educational system. These groups do not fully share power with the dominant group and tend to fall into the lower socio-economic groups in the country. They frequently have a history of brutal subjugation and denigration of their way of life. Such groups may reject outright the systems and values of the dominant group. Some Aboriginals in Australia react to the dominant group's education system by resisting it or by ritualizing it (Teasdale 1990). Such ritualizing is explained by Christie and Harris (1985). In their study they found that Aboriginal students exhibited three beliefs about the way they would achieve their education:

Firstly, their mere presence in school ritually endows them with education. Secondly, the careful performance of ritualised classroom activities (copying from the blackboard, reading loudly in chorus, etc.) is efficacious. Thirdly, the age gradestages as they move up through school (rather than by any particular school-learned skill like the ability to read and write). The individual creative and self-directed effort which is crucial to academic learning, is de-emphasised and, in fact, considered irrelevant.

(Christie and Harris 1985:83)

Attitudes at macrolevel toward the educational system of the dominant group or culture may result in two forms of actions: an attempt to learn the rules and forms of behaviours to operate in the dominant group while minimizing its effect on their own value systems, or an outright rejection of the values of the dominant group and therefore its educational system. Such rejection at the global level results in a rejection also of the new literate behaviours in the second language (or dialect in
some cases) that are critical in a formal school system. The choice is not a simple one, but as Cole and Bruner (1971) point out when cultures are in competition for resources, as they are today, the psychologist’s task is to analyse the source of cultural difference so that those of the minority, the less powerful group, may quickly acquire the intellectual instruments necessary for success of the dominant culture, should they so choose.

(Cole and Bruner 1971:246, emphasis added)

It would seem newer ways of educating the less dominant groups in a society need to be explored (Lucas and Katz 1994). In the Australian context, for example, two-way schooling has been established for isolated Aboriginal communities, where skills and knowledge from both the Aboriginal communities and the wider community are taught and highly valued. The processes of learning for the two types of knowledge and skills are distinct and relate to respective cultures. Importantly, the whole enterprise is controlled by Aboriginal people (Harris 1990).

**PEDAGOGICAL IMPLICATIONS**

The paper has argued that the way and purposes for which language is used in one’s primary socialisation may have some impact upon second language learning and use. One pedagogical implication, especially that in relation to language use, is to sensitise teachers to the types of differences rooted in understandings about language use developed during the primary socialization of their learners and brought to the ESL learning task. These differences are more marked for learners from some groups whose primary socialisation instil values and attitudes that are quite different from those of the target language speakers. However, any implications that are drawn have to take into account the precise backgrounds of the learners: (1) whether the second language is being learned in their home countries or in the TL country, (2) the age of the learners, (3) the level of literacy in the L1, (4) the power relations with the dominant group if learners come from a minority group, and so on. As a corollary to the sensitization of language teachers is the need for teachers to reflect upon the ways of learning that students bring to classrooms and consider some of these as strengths upon which future learning can be built (Maley 1984, Tinkham 1989, Luke 1996). Evidence shown by Fillmore (1983) lends support to this. In her study of good
language learners she found that 4 of the 18 good language learners were shy and uncommunicative, but very attentive listeners and quite observant. While our current understandings about the role of interaction in the development of second language would lead us to believe that these learners might not have made as much progress as those who participated in classroom activities more actively, this was not the case.

These children tended to pay close attention when their teachers talked to them, and they seemed to be observing, if not participating in, most of the activities that took place in the classroom around them.... Such learners generally gave little evidence that they were learning anything, at least until they were prodded into making some sort of response to our elicitation efforts. Then they let us know that there is more than one way to learn a new language.

(Fillmore 1983:165, emphasis added)

The work of Fillmore and her colleagues is a reminder to the field of second language teachers, especially of English, to reflect on itself to see whether there might not be elements of Euro-centrism in the second language learning and teaching approaches that are advocated and are used in classrooms (see also Riley 1988, Tinkham 1989, Maley 1983, Barnlund 1987, Oster 1989, Burnaby and Yilin Sun 1989, Fairclough 1989, Holliday, 1994 and Tollefson 1991).

The type of action that teachers may take in their classrooms depends upon the instructional context. Such action may be more difficult in some contexts than in others. For example, where classes have learners from a variety of backgrounds it may not be possible to devise one pedagogical solution. Teaching strategies that incorporate more group work or ones that make more explicit the demands of the task in a second language (see Oi 1986, Bassino 1986) need further investigation. On the other hand, there are contexts in which classes are more homogeneous in terms of the background(s) of the students. Two broad types of actions that are possible in such contexts are suggested, exemplified with some successful examples.

The first type of action attempts to incorporate into classroom pedagogy certain aspects of the cultural practices of learners so that there is a greater compatibility between the teaching act and the ways of learning and behaving which students bring to the learning environment. One such early experiment was conducted in Warm Springs Indian Reservation in the USA (Phillips 1972), which showed that changes in
the participant structure in class so that the occurrence of speech was not dictated solely by the teacher resulted in a better learning environment for the students.

Another successful example of culturally sensitive pedagogical modification is the Hawaiian Kamehameha Early Education Program (KEEP) (Au and Jordan 1981). In this early reading programme, the emphasis in reading was changed from phonics to comprehension. In addition, the classroom organisation was altered so that students were working in small groups (usually three to five students) in what were called 'learning centers'. Direct interaction with the teacher on a one-to-one basis was limited to about 20-25 minutes per day. This approach has produced much better reading results. Au and Jordan (1981) conclude that:

a major problem in teaching Hawaiian children to read appears to be that they do not recognise ordinary reading lessons as situations which call for the application of their full range of cognitive and linguistic abilities. The KEEP program seems to be effective at least partly because it employs a special type of reading lesson, one which resembles talk story and storytelling, major speech events in Hawaiian culture.

(Au and Jordan 1981:151)

More recently, Ladson-Billings (1995) studied the pedagogical practices of eight exemplary teachers of Afro-American students and identified three key factors: (1) the conceptions of self and others held by the teachers, (2) the manner in which social relations are structured by the teachers, and (3) the conceptions of knowledge held by the teachers. Ladson-Billings' work emphasises the critical role of cultural awareness in both the types of relationships that are established in classroom and in ways that knowledge is constructed.

A similar sympathetic orientation can be seen in the work that is being carried out by the National Center for Research on Cultural Diversity and Second Language Learning in California. Its approach to ESL learning eschews a single model for all low English proficiency students. Instead, it seeks to encourage teachers to adjust the curriculum, and method of instruction, and to use the L1 to meet the varying needs of students. Such an orientation encourages teachers to guide students towards the discovery of a deeper understanding of the pedagogical material through discussion that takes into account student ideas and
Francis Mangubhai

background, what Luke (1996) has described as taking into account the “cultural capital” that learners bring to learning.

A somewhat different form of adaptation is suggested by Malcolm (1987), an adaptation that is two way. He suggests that both students and teachers have to change to meet the challenges of a particular classroom, a point not unlike that made by Jordan (1985):

Educational practices must match with the children’s culture in ways which ensure the generation of academically important behaviours. It does not mean that all school practices need be completely congruent with natal cultural practices, in the sense of exactly or even closely matching or agreeing with them. The point of cultural compatibility is that the natal culture is used as a guide in the selection of educational program elements so that academically desired behaviours are produced and undesired behaviours are avoided.

(Jordan 1985:110)

The examples given above reflect an understanding of the language and learning practices of a group of students incorporated into pedagogical practices so that the disjuncture between patterns of learning and language use internalised during one’s primary socialization is made less marked. They do not suggest the transfer of social practices holus-bolus into the classroom because that may be quite inappropriate for the longer term development of academic abilities of students in an institution that is primarily a particular type of literate environment (Olson 1977).4

The second type of action is exemplified by some work carried out in Fiji. In the Fijian context, particularly in the rural areas, there are very few reading materials in any language available, and both the indigenous Fijian and Indo-Fijian (East Asians) societies generally do not actively encourage wide reading. In the former society a ‘legitimate’ form of reading involves religious texts while in the latter the texts, for students, are school textbooks. (In urban areas the the range of reading is much wider for both social groups and many tertiary-educated parents do encourage wider reading, but the patterns of interaction based on book reading found in similar homes in English-speaking societies is generally absent (cf. Heath 1982, for example).) In order to bridge the gap between the types of reading activities fostered in schools and in the home communities, it was decided to provide high-interest, well-illustrated story books in English5 for students in Grades 4 and 5 in rural areas to read on a regular basis in their classrooms (see Eiley and Mangubhai
Teaching Language, Teaching Culture

1981a, 1981b, 1983, Mangubhai 1986b). The project, called Book Flood, placed about about 250 books into each of Grades 4 and 5 and teachers were asked to provide 20-30 minutes of classroom time for students to read them. The reading activity replaced other activities in the normal structurally-based ESL program.

At the end of the first year the Book Flood classes were significantly better than the control classes in English reading and listening comprehension and grammar, but not in writing. The experiment was carried on for another year into Grades 5 and 6. At the end of the second year, the Book Flood classes continued the gains in reading and listening comprehension and grammar, and were significantly better than the control classes on a writing test. The modal mark in writing for the experimental group was 9 out of 10, while for the control group it was only 2, a difference that is obvious in the examples below:

**Experimental Group**

- One morning when Luke’s mother was washing, and the men were drinking yagona, Luke was boiling the water.

- One day, Tomasi’s mother was washing clothes beside the river, Tomasi’s father was drinking yagona under a shady tree, Tomasi was cooking the food beside their house, and his brother was carrying buckets of water.

**Control Group**

- Is ther the women in the tree, Mothe zig in the tree thee was a looking at hes mother...

- One day there boy Seru is make the tea to drinking his mouth was the colhn.

- One day morning their were a house any village by the sea ...

Moreover, an analysis of the results of a national examination at Grade 6 that only the indigenous Fijians took showed that students from Book Flood classes outperformed students from the control classes in Social Studies, Mathematics and even in the Fijian language test.

This project provided opportunities for students to participate in behaviours in the formal school system that were largely absent in their societies, behaviours that are more critical for academic achievement as one moves up the grades of primary level into high school. It provided what Wells (1981) has suggested:
Where the skills associated with the representation of meaning in written language are not used or valued by the parents and other adults in the home environment, children will be less likely to accept the school’s valuation of them, or to receive encouragement to persist with tasks that they may initially find difficult or lacking in meaning. However, even with lack of home support, it should be possible for a child to make progress commensurate with his intellectual potential, if appropriate opportunities are provided at school.

(Wells 1981:264 265, emphasis added)

The type of books and the stress-free environment in which reading could be carried out by students made this an enjoyable activity for them and lent legitimacy to this behaviour within the classroom culture.

A RESEARCH AGENDA

The ESL field has not considered whether some approaches to learning that students bring with them can be utilised positively in language classrooms. For example, it is frequently stated in literature that some groups of second language learners are predisposed to rote learn. Can this approach to learning be utilised in order to teach, particularly at lower levels, chunks of languages that would be useful in conversational interactions and encouraging these students later to analyze them so that the resultant linguistic knowledge can be used more creatively? Tinkham (1989), for example, compared attitudes of Japanese and American students towards both rote learning and more creative learning and compared students’ performance, given similar rote learning tasks. He found that his Japanese subjects did better at the rote learning task than the American students and suggests that teachers should take advantage of the strengths of students.

Following suggestions made by the National Center for Research on Cultural Diversity and Second Language Learning and those of Lucas and Katz (1994), there is a need for the field of TESOL to look at the place of the first language in second language learning. To take the specific case of translation, we need to determine whether such behaviours assist in language development at some stage of second language learning, possibly at the earlier stages. Current practices have tended to frown upon translation and have encouraged students to think in the second language as much as possible. In fact, we do not have any...
research to show at what stage students begin to think more in the second language and resort to translation only when there is a serious problem in communication or understanding. In fact, it may be that translation is not a function of proficiency in the second language per se. Mangubhai (1991) found that one of his subjects tried to comprehend the second language from the very early stages of her learning and resorted to translation of utterances only when comprehension problems were encountered. It is likely that even at more advanced stages a certain amount of translation may occur when comprehension difficulties arise. The role of translation in second language learning should become part of our research agenda so that we have a better understanding of the cognitive behaviours of learners at various stages of proficiency in second language (see also Cohen 1995). If research were to show, for example, that there is a transition to thinking more in the target language at a particular level of proficiency (the definition of which, admittedly, may present another problem to solve), then teachers could begin to give positive encouragement to a shift towards thinking more in the second language for those students who theoretically ought to be able to do so.

A number of recent studies have shown that, for some learners, writing in L1 and then translating it into English produces a better product than when there is no opportunity to think through and write in the L1 (Kobayashi and Rimmert 1992, Brooks 1993). Similarly, Kern (1994) has shown that there is a role for translation in second language reading if it is used sensibly. These studies are an acknowledgment that translation does occur and that research needs to determine the circumstances under which it is most effective.

If research shows that certain approaches brought by learners to the task of learning a second language are an impediment to second language development then we can turn to the problem of the most efficacious ways in which teaching can be organised to take into account the learners’ approaches. More importantly, it can begin to investigate effective ways to assist students in making the transition from their ways of learning to other, more efficient, ways of learning, taking into account the important role of affect as it relates to changes that teachers might wish to see in their students (see, for example, Oi and Kamimura 1995, who use a certain pedagogical strategy to raise the awareness of their students about the requirements of an argumentative essay in English).

Minimally, the research agenda in the area of cultural factors and second language learning should address the following questions:
1. (a) What are the learning approaches and strategies second language learners of different cultures bring to the learning task?
   (b) Which of these approaches or strategies do not lead to more efficient learning?
   (c) Which pedagogical (and other) strategies are most effective in helping students to incorporate other approaches and strategies to second language learning?

2. (a) Does a gradual change to other forms of instruction advocated in the literature on ESL teaching (for example, interactional) produce a better result than a sharp disjuncture between the instructional and learning modes of the learners and of the classroom?
   (b) Is this transition tied to level of proficiency or can it occur at all levels?

3. Is there a change in affect, lowering the affective filter (Krashen 1982), when pedagogical approaches take into account the learners’ view of knowledge (and skills) and the manner of their acquisition?

CONCLUSION

This paper has argued that primary socialization is a process of legitimizing language use in a society so that some uses become more salient and socially approved, while other uses are not given a social value. In learning a second language, learners have to learn to use and value other uses of language, which incorporate attitudes that may be in conflict with those developed during their primary socialization. Such conflicts are not easily resolved by some and require a sensitive approach on the part of the teacher in the classroom. In some instances values of the learner group may be so different, and their experiences at the hands of a dominant group so negative, that there may be a complete rejection of the values of the dominant group, with the resultant lack of achievement in the educational settings reflecting those values.

The paper also has also discussed selected examples of successful pedagogical approaches which take into account the cultural practices of learners or provide types of experiences which are absent in a social group but which are critical in an English-speaking educational context for success in that system. Through the discussion of the above matters and a suggested agenda for research, the question posed by Riley (1988) at the beginning of this paper is answered in the affirmative: that cultural factors do need to be taken into account when teaching a second language and not be conflated into a factor such as individual differences.
Teaching Language, Teaching Culture

NOTES

1. What Scollon and Scollon found with the Athabascan Indians is also true in Fiji. When I worked in the Curriculum Development Unit of the Fiji Ministry of Education I had to chair occasional meetings called to consider some changes in curriculum that were advocated by the Minister of Education. Fiji has two major ethnic groups, the indigenous Fijians and the Indians. The latter were a bit like the American English speakers that Scollon and Scollon (1991) described, and if there was a pause they would begin speaking. In order to ensure that the Fijian members of the staff present at the meeting also had the opportunity to express their views, I frequently had to nominate them and ask them for their opinion. It was usually obvious from their replies that the matter under discussion had been given some thought by them and that they had followed the discussions quite closely, and they made a valuable contribution to the discussions.

2. Compare, however, buying an ice-cream, for example, where the topic is introduced immediately—'one nun-and-raisin, please'—because the context for the interaction is predetermined and the attention of the seller is automatically expected.

3. Compare the attitude of the Chinese towards children's achievement at school. Education is regarded as an individual affair by both child and parent. If children do not do well at school, they are blamed, not the school or teachers (Piek 1991).

4. Martin Nakata (1993) has attacked this assumption, arguing that the western education system should be problematised vis-à-vis learners from a society that has been colonised. He states that 'to represent the Torres Strait Islander (in Australia) in other thematic schemes without making problematic the policies of culture itself would be to accept epistemological schemas already in place, and to accept 'givens' and 'taken-for-granted' apparatuses that constitute fundamental premises between the dominant and the Islander' (p. 342).

5. English was chosen because there was little appropriate reading matter for children in the vernaculars. In addition, by Grade 4 students have been learning English for three years and it becomes the language of instruction from Grade 4. In the first three years the language of instruction is either Fijian or Hindi.

6. One half of the experimental group read them silently using the USSR method (McCranken 1971), while the other half spent their allocated time in a Shared Book approach to reading (Holdaway 1979).

7. Rote learning is a 'dirty' word in education but in certain contexts it may be an appropriate solution, especially in cases where there are only a few instances of a concept so that searching for the correct attribute may not be possible because of fewer trials.

8. Translation has been suggested as a positive strategy by, for example, Oxford (1990).

EVERYDAY SPEECH AS CULTURE:
IMPLICATIONS FOR LANGUAGE TEACHING

Anthony J. Liddicoat
Australian National University

INTRODUCTION

Recently the role of culture in language teaching has become increasingly important. In Australia, for example, cultural understanding has been included as the eighth key competency and cultural elements have been included in the curriculum statements and profiles for Languages (Australian Education Foundation 1994a) and English as a Second Language (Australian Education Foundation 1994b). At the same time, the understanding of what culture is and the ways it reflects language has changed considerably. In particular the relationship between culture and the everyday spoken language used in a society is something which has only recently come to be studied (for example Moerman 1988). This paper will examine the relationship between spoken language and culture from the perspective of language teaching and look at ways in which the study of naturally occurring conversation can be a useful tool in developing the teaching of culture in interaction.

The idea of incorporating cultural material into a language program is not new. What is new in contemporary approaches to language and culture is the ways in which cultural material is understood. In particular, those aspects of culture which underlie the ways in which people communicate every day are of particular importance in a communicative approach to language teaching. If languages are taught on the basis of messages that need to be communicated in the language, the appropriate ways to communicate such messages in the culture also needs to be taught. That is, the communicative approach must be a cultural approach if it is to achieve the objectives it has set for itself.
Teaching Language, Teaching Culture

It is indisputable that the communicative approach to language teaching has revolutionized language programs and language text books. Language teachers are now aware of the language functions which students need to be able to control, and of the tasks which students need to be able to accomplish through language. However, the revolution has only gone so far. The cultural implications of using language to communicate have often not been fully recognized. When a person begins to communicate a message in another language, s/he not only begins to exploit language functions, s/he begins to function within a cultural context. In fact s/he begins to participate in a culture.

Many of our current materials, while focusing on communicatively important language functions, present those functions within a cultural context which is often the culture of the learner, and in many cases within the school or university culture of the learner. In fact, many language text books written for foreign learners outside the country of the target language strive to be as relevant to the culture of the learner as possible (Kramsch 1993), often neglecting the target culture or separating it from the language material in the text. Text books written in the country of the target language, however, may contain much cultural material, but without making it explicit.

Language learners may therefore receive little input about the way the language which they are learning is used by native speakers, but when language learners use the target language to speak with native speakers, they immediately begin to participate in the target culture. The communicative approach equips learners with things to say, but it has usually not equipped them with the cultural knowledge they need in order to know what to say when and to whom. For example, a text book may give a series of forms for requesting in the target language, but may not provide information on the politeness level of these forms or the appropriate context in which such forms can be used. Faced with this lack of knowledge, the learner usually falls back on the only cultural knowledge s/he has – his/her own culture. Sometimes this helps, but sometimes it can lead into disaster. Things which can be appropriately said at a given point in a conversation in one culture may not be appropriately said in another culture at that point in a conversation.

The divergence between the materials which are used for language teaching and the actual ways of speaking used in the languages they teach
can be seen in examining some specific examples of interactions in which language learners are likely to be involved. In many cases, the text books simply do not consider the necessity for indicating different cultural perspectives of common language-based activities such as beginning or ending a conversation. For example, Crozet (1995) has shown that available text books for tertiary level French students are very limited in the amount of information they give about the patterns of interaction in French. However, the problem is much more general.

TEXT BOOKS AND THE SOCIO-CULTURAL COMPONENTS OF 'SIMPLE 'LANGUAGE

It is the argument of this paper that even very simple language has the potential to reflect cultural differences between languages. However, text books tend to ignore the possibilities for differences. In some cases, texts are pruned of information which is not felt to be relevant to the point under discussion – this is particularly the case with opening and closing sequences in dialogues. In other cases, they present the information in such a way as it distorts actual practices or they present an oversimplified picture of practices in conversation which conceals the potential for difference. We can see these factors at work in the ways in which greeting and farewelling are presented in text books for French and Spanish. In each case, the picture presented by the text book is not an accurate reflection of conversational practice in the language.

Starting a conversation in French

Beginning a conversation is a very important activity and one which establishes clear first impressions in encounters with new people. It involves much more than just saying “hello”, as there are a number of rituals about when to say “hello”, making eye contact with you interlocutor, and what else you say which are important in beginning to talk. The beginning of a conversation is an important part of the conversation, and talk here establishes an interaction in a way which may be pleasant or unpleasant. Also, the talk carried out in conversational openings is quite highly structured (see for example Schegloff 1986). It is therefore particularly important that students who are learning another
Teaching Language, Teaching Culture

language learn the appropriate ways to begin a conversation in the target language culture.

There are some striking differences between the ways that conversations get started in French and in Australian English, and learning to begin a telephone conversation is something which is introduced quite early in language text books. In a typical beginners text in French (Espaces 1 Capelle and Gidon 1990) which is shown in Figure 1, the student is given a brief introduction to telephone conversations in French.

Figure 1: Telephone opening in Espaces 1

In this text there are two conversations. In the first conversation there is a wrong number. The conversation begins with the caller saying *allo* the French word for answering a telephone followed by an enquiry about the number. The answerer gives his correct number and the caller apologizes. In the second call, the caller begins with a number, then says *allo* and checks the number. This time it is the correct number and so the
answerer gives his name and asks who is calling, the caller gives his name and the answerer recognizes him. Even though the people do not recognize each other initially, it can be seen that they are friends because the answerer calls the caller tu the familiar form of 'you'. In this conversation, there are a number of problems, the most important being that it is the caller who speaks first. This is not what happens in English, and the question can be raised about whether or not this text is providing information about a cultural difference in French. The study of telephone openings (Liddicoat 1995) suggests that this is not typical. The usual beginning of a telephone call in French has the form given below.

C: Caller
A: Answerer

((ring))
A: allo
C: oh Yves,
A: oui
C: c'est Valérie
A: ah bonjour Valérie.
C: bonjour
A: ça va?
C: ouais ça va et toi?
A: ouais
C: je te dérange?
A: ben non
C: dis, je veux savoir ...

A: hello
C: oh Yves,
A: yeah
C: it's Valérie
A: ah he tilc Valérie
C: hello
A: how are you?
C: okay and how about you?
A: okay
C: am I bothering you?
A: no
C: well, I want to know...

(Source: Barraja-Rohan 1994)

What can be seen here is a conversation between two people who know each other, but who are not sure if they are speaking to the right
Teaching Language, Teaching Culture

person. It can also be seen that it is the answerer who says allo here not the caller, just as in English. Then the caller checks the name to see if it is really Yves she is talking to, he says it is and then Valérie identifies herself. After that they ask how each other are and then proceed to the telephone conversation. The text book example has not shown any of these features, but instead gives a misleading picture of the nature of telephone openings in French – one which will not be useful for the learner to follow when talking with native-speaker friends.

There is more to starting a conversation than just saying hello. Significant differences exist between French and English in many of the ways in which interaction are begun. In her study of interaction between French and Australian employees in a multinational company in Australia Béal (1990) found that the situation was quite complex and that many interactions could break down at this fundamental stage.

The example given below is an example of an interaction between two Australians when one has to enter the office of the other.

Typist: ((at door)) excuse me, Anna.
Anna: ((looks up))
Typist: ((walks in and shows papers)) one?

(Source: Béal 1990)

What can be seen here is a situation in which Anna is in her office with the door open. The typist wants to make a query about the text she is typing. She stops at the doorway and attracts Anna’s attention. When she is acknowledged, the typist walks up to her and begins to speak. This example can now be compared with an example involving two French people doing the same thing.

Denis: ((looks up as Catherine walks into office))
catherine: est-ce qu’il faut faire taper le rapport? should I get the report typed?

(Source: Béal 1990)

Here a different set of principles is involved although the situation is the same. Denis is in his office with the door open, and Catherine wants to talk to him about some typing. In this case, Catherine walks into the office
without attracting Denis’ attention, and Denis looks up as he notices her come in. After this Catherine begins to talk. In this example there is a very different set of rules about how to treat an open doorway (walk in or not walk in) and who is responsible for noticing the other (in French the person approached has to notice the person approaching, but in English the person approaching has to get the attention of the person being approached).

When people from different cultures meet, these conflicting rules cause problems. For an Australian, an office is personal space and the open door represents a barrier which people can only cross once permission has been given. To enter an office without such permission is an invasion of personal space and is viewed negatively in the culture. Therefore, if you want to enter an office in an Australian cultural context, you have to seek permission to enter, and this takes the form of attracting the attention of the person who occupies the office. Because the office is a contained space, this means that the area beyond the office represents a different space and the occupier of the office has no reason to pay attention to people outside the office, even if they are visible. In the French cultural context, however, an office is part of the common work environment and so an open door is not a barrier. Instead, the open door makes the office a part of the shared space of the workers in the company. Also, when a French person notices that there is someone in the same space as him/her, s/he should make eye contact with this person. It would be rude not to do so. As the doorway to an office is not a barrier, the occupier of the office should acknowledge people who enter his/her field of vision as soon as they do so, even if they are outside the office area. It can be seen in these two examples that there is a culturally different way of understanding how space is organized and that this understanding affects the ways in which people interact.

Saying “goodbye” in Spanish

An important, and often difficult, part of any conversation is the closing. In any conversation, there is more to ending the talk than just saying “goodbye”. Closings have to be negotiated so that all of the participants feel happy to end the conversation and so that none of the people involved
is felt to be impolite or unfriendly (Schegloff and Sacks 1973). In short, there are appropriate times to say goodbye and there are appropriate ways of saying goodbye.

The introductory Spanish text book, *Dos Mundos* (Terrell, Andrade, Egasse and Muñoz 1990a), gives only the information shown in Figure 2 about saying goodbye in Spanish.

**LOS SALUDOS Y LAS DESPEDIDAS**

- Mucho gusto.
- ¿Cómo está usted? Hasta luego.
- Igualmente.
- Muy bien gracias.

*Figure 2: Opening and closing a conversation in Dos Mundos*

The text book provides just a single lexical item which equate with 'goodbye', although the list is far from complete. What the text book does not give is a description of the ways in which these words can be used. Obviously, the understanding that a language learner would get from such a text is that *hasta luego* is equal to English *goodbye*, and that they are used in similar ways in closing a conversation. In the workbook (Terrell, Andrade, Egasse and Muñoz 1990b), as an additional reading, the following information is given:

Cuando una persona se va, también es costumbre despedirse dándoles la mano a todos otra vez y diciendo por ejemplo, «Adiós», «Nos vemos», «Gusto de verte» o «Hasta mañana». Los saludos y las despedidas pueden durar mucho tiempo, pero valen la pena. ¡Muchos hispanos creen que las relaciones humanas son más importantes que el tiempo!

[When a person leaves, it is also customary to say goodbye by shaking hands with everyone once again and saying for example "Goodbye", "We'll meet again", "Good to see you", "See you tomorrow". Greetings and farewells can last for a long time, but they are worth the effort. Many Hispanic people believe that human relations are more important than time.]

(Terrell, Andrade, Egasse and Muñoz 1990b:42)
The work book gives some additional information compared with the text book, such as the importance of shaking hands when leaving, and also a number of new vocabulary items to fill the goodbye slot. It indicates that the process of farewelling may take a large amount of time, and also gives a cultural basis for this. What is highlighted here is the amount of time spent saying goodbye. This description is actually quite a contrast to the wave and hasta luego shown by the text book.

With this in mind, consider the following conversation, recorded at a wedding reception in Bogotá, Colombia (Fitch 1991). The conversation is between a guest and the two hosts. The hosts are brothers and the reception is held in their home. They do not know the guest. The guest wants to go home. What could be simpler than saying goodbye at the end of a party? Here is the actual conversation:

G: Guest
H1: First Host
H2: Second Host

G: me voy.
H1: se va? por qué?
G: la tarjeta dice muy claramente que de 7 a 10 y ya son las 10:30.
H2: pero que va, yo hasta las cinco y media de la mañana estoy aquí.
G: [heh heh heh]
G: =pero me tengo que ir-
H1: =hmf, que se tiene que ir, y por qué.
G: por que vivo lejos.
H2: [pero] no importa
H1: hmf, dijiste que voy así no tienes más, me voy.
G: [heh heh ha ha ha has]
(0.3)
pero es tengo que salir aoger pues-
H2: =no, no, luego le llevemos!
H1: [ro:me] se otro ¡aguito! [ran]
H2: lo se van con Alberto que vive por alla y tiene carro

G: I'm leaving.
H1 you're leaving? why?
Teaching Language, Teaching Culture

G: the little card [invitation] said very clearly from 7 to 10 and it's now 10:30.
H2: but so what, I'll be here until five
thirty in the mor[ning]
G: [heh heh heh]
G: =but I have to go=
H1: =hmf, that you have to go. and why,
G: because I live [far away]
H2: [but that] doesn't matter
H1: hmf. says he's going just like
just like { that, I'm going }
G: [heh heh ha ha ha ha]
(0.3)
G: But it's that I have to go catch a bus=
H2: no, no later {we'll take} you
H1: [ have ] another
little drink [brother]
H2: [or go] with Alberto
who lives out there and has a car

(Fitch 1991)

After this conversation the guest returned to the party and remained there for another hour before finally leaving.

To someone operating in an English cultural framework, this would appear to be a very uncomfortable situation. The guest wants to leave, the hosts are preventing him and denying the guest the right to decide for himself when it is time to go. In an English environment, this sort of behaviour may be acceptable for people who know each other well, but for total strangers it is most unusual.

In the Colombian cultural context, this is not an unpleasant conversation. This is a friendly exchange, and not only that, it is a typical exchange when leaving a party. In the transcription, the conversation proceed rapidly, the utterances are latched on to each other without pausing or hesitation, or else they overlap. If this were uncomfortable, then we would expect indications of this, such as hesitations and pauses, from all or participants or from the guest at least. Moreover the guest is laughing when his reasons are denied and that the laughter is pre-emptive—it is a response to a guess about where the turn was going. Pre-emptive laughter is typical of a response to humour (Scherzer 1985, Sacks 1978). These sorts of features of this segment of talk show us that this is not a confrontation. What can be seen here is a typical ritualized utterance.
which occurs during leave-taking at a party. Its equivalent in English would be something like:

G: I have to go now
H: well it was nice of you to come
G: thanks for a wonderful party

What can be seen happening here are two different culturally based sets of rules about what is appropriate behaviour when leaving a social gathering. For speakers who know these rules the interactions flow in acceptable and friendly ways, for those who do not know the rules each of these interactions allows the possibility for serious misunderstandings. I will return to this potential conflict later, but first let us examine the rules which underlie the Colombian closing sequence. Fitch (1991) describes the routine as being made up of a four part sequence in which each part performs a specific function in achieving the entire routine:

1. Guest announces an intention to leave
2. Host asks for an account of this behaviour
3. Guest provides an account
4. Host denies the account and/or offers an alternative

This is played out as follows:

1. G announces intention me voy.
2. H asks for an account se va? por qué?
3. G provides account la tarjeta decía muy claramente que de 7 a 10 y ya son las 10:30.
4. H denies account pero que yo, yo hasta las cinco y media de la mañana estoy aquí=

G: [heh heh heh]

This routine is then repeated:

1. G announces intention =pero me tengo que ir=
2. H asks for an account =hmf, que se tiene que ir.
y por qué
3. G provides account por que vivo lejos
4a. H denies account [pero] no importa
4b. H denies account hmf, dijiste me voy así no más, me voy

G: [heh heh ha ha ha ha]
Teaching Language, Teaching Culture

In these examples the guest’s laughter comes at the end of each completion of the sequence. These two sequences are followed by an incomplete third repetition of the sequence:

3. G provides account  pero es tengo que salir a coger bus=
4a. H denies account  =no, no, luego le lle[vemos]
4b. H provides alternative  [ to me ]
                    se otro traguito [ mano ]
4c. H provides alternative  . [o se va] con
                         Alberto que vive por alla y tiene caro

What can be seen here is a definable sequence, with recognizable stages which the participants proceed through in order to accomplish the purposes of the talk. This routine is part of the talk you go through in order to leave and it is a leave-taking, but with different rules from leave-taking in English. Firstly, you cannot leave without going through this ritual as it would be considered rude. Moreover, leaving immediately after this ritual would also be considered impolite. The usual time to leave is about an hour after having expressed your intention to your host and having yielded to his/her argument that you should not go. In addition, it would be considered impolite if the host did not try to dissuade the guest from leaving as the denial shows interest in the guest. To omit this would indicate boredom or antagonism — it would mean that the hosts had not really wanted the guest at the party at all (Fitch 1991). It is quite simply that the elements in this sequence which to English eyes show the most confrontation in Colombian eyes show friendliness. “Hosts vigorously oppose guests’ leaving whether or not they have a sincere interest in the guests’ remaining” (Fitch 1991:220).

The English leave-taking given above also presents a possibility for misunderstanding. It has the form:

1. Guest announces intention to leave
2. Host expresses regret
3. Guest thanks host
4. Both parties close the conversation and guest leaves

For a Colombian, this sequence would appear to be most impolite, as it expresses a negative attitude toward the guest and also a negative attitude
from the guest who does not wish to continue to enjoy the host’s hospitality.

WHAT DO WE NEED TO TEACH?

The situation shown here with the Colombian leave-taking ritual is an extreme example. However, there are many situations in everyday life in which the sequencing of talk shows culturally determined practices. Take for example:

- How do you start a conversation?

- What do you say when someone asks you “Did you have a good weekend”?

- What are the functions of questions such as “How are you”? Are they legitimate questions about the state of one’s health or are they used as ritualized utterances? In either case, what are culturally appropriate things to say in this position?

- What do you say at the end of a conversation to show that it is time to end but which lets your interlocutor know that you are not trying to escape? When is it “safe” to end a conversation?

- How do you change the topic so you can talk about what you want to talk about but not upset the person you’re talking to?

- How do you get to tell a story or a joke?

- Can you interrupt? How do you interrupt? Where do you interrupt? In French an interruption which is co-operative (that is it is about the same idea/proposition) is a sign of interest, in other languages it may be perceived differently (cf. Kerbrat-Orecchioni 1993).

It is vitally important that learners of a language learn at least some of these things. These are the sorts of things they need to know if native speakers are going to consider them interesting and appropriate partners in talk. Language users who can control some of these things will have satisfying encounters with native speakers, those who don’t will have difficulties or negative experiences in talking with native speakers. If
Teaching Language, Teaching Culture

culture is seen as linked to everyday conversation, we can get to a level of culture which can make or break an interaction. If language learners understand the cultural rules that others use, they can have satisfying interactions in the target language. If they do not understand them, then they are likely to be involved in situations in which polite behaviour is interpreted as impolite and friendliness as unfriendliness – guaranteeing a negative experience of the target culture, its people and its language. 

This does not mean that learners are to be assimilated into the target culture, rather they have to find their own third position between the two cultures involved (Kramsch 1993, Liddicoat 1997). As such, it is the learners' choice to decide how much of the culture they will use in constructing this third position, however, in terms of language teaching, the learners need information about the culture in order to construct their identity. It is not vital that learners' language production is nativelike in this sense. It is vital that their perception is informed by native speaker norms. The language learner needs to understand what native speakers mean when they use the language, even if they do not choose to replicate native speakers' behaviour.

Any contribution to talk achieves an effect and this effect is interpretable by other participants. However, what effect is achieved by any particular contribution may vary from language to language. That is, not all structurally similar utterances are interactionally similar. All utterances do something in conversation and we achieve our identity in our own eyes and in the eyes of others by what we do in conversation (Sacks 1984). While it is not appropriate in language teaching to require learners to be someone they are not, nonetheless learners need to know the consequences of the interactional choices they make. Language learners need to know what communicative effect their talk is likely to produce and how they will be perceived by native speakers of the language. If they choose not to adopt native speaker-like norms, this needs to be an informed choice.

In order for learners to understand the interactional consequences of their verbal behaviour, we need to know more about how speakers of languages structure their talk. We also need to know what people actually do with their language, not what they think they do, as many of the culturally loaded aspects of language use can be deeply ingrained and
unconscious. As such we need to use naturally occurring data and detailed micro-level analyses, which allow us to see exactly what is going on in a speech situation, if we are to describe the cultural conventions which make up this particular aspect of conversational interaction. What such study shows, then, is the nature of the rules of language which underlie an encounter. It has given us a grammar of the speech event and has allowed us to work out how utterances are functioning within the speech event to achieve the goals of the participants.

The rules which apply in speaking a second language cannot be 'picked up' by the language learner unless s/he has extensive exposure to the target culture. Even then some aspects of culture such as closing a conversation may be difficult to pick up. Language learners need to be exposed explicitly to the cultural rules which govern speaking in the target language (Crozet 1996). The cultural basis of talking, the norms of interaction, need to be incorporated into language programs in a systematic way, just as other aspects of communication need to be incorporated. If the language teaching profession is serious about teaching language communicatively, second language learners need to be equipped with conversational skills to interact successfully with native speakers. Information from the study of conversational rules provides a central link between language and socio-cultural norms which can form the basis for materials and program designs which incorporate this aspect of language into the second language program.

TEACHING CONVERSATION AND SOCIOCULTURAL NORMS WITH CONVERSATION ANALYSIS

Anne-Marie Barraja-Rohan
Western Melbourne Institute of TAFE

INTRODUCTION

The aim of this paper is to show how conversational English and sociocultural norms can be taught in an ESL/EFL context and have been taught successfully in adult ESL classes by utilising the findings of Conversation Analysis as well as aspects of pragmatics. In so doing, a new methodology to teach conversation is emerging which has been the result of nearly two years of classroom-based research (for more detail, see Barraja-Rohan and Pritchard 1995a, 1995b and Barraja-Rohan and Pritchard forthcoming). This new methodology is being encapsulated in a coursebook that is being currently developed and trialed. The coursebook that Ruth Pritchard and I are presently writing is designed for Migrant Access and aims at lower intermediate to upper intermediate (ASLPR 1/2+).

This paper will be structured as follows. First, I will give a definition of conversation and outline the reasons why we need to teach it. Second, I will give a rationale for the creation of the coursebook by explaining how some difficulties in teaching conversation can be dealt with and by looking at what is involved in conversation. Lastly, I will explore the teaching methodology and what needs to be taught.

WHY DO WE NEED TO TEACH CONVERSATION?

We need to teach conversation simply because conversation is an everyday and pervasive phenomenon. Conversation takes the form of a spoken interaction between participants. It has a social purpose as
Teaching Language, Teaching Culture

ordinary or casual conversation "is the predominant medium of interaction in the social world" as Drew and Heritage put it (1992:19). Drew and Heritage (1992) go on to say that ordinary conversation constitutes the base of all kinds of spoken interaction such as what is called institutional talk. Institutional talk is characterised by spoken interactions that take place in a formal setting like schools, hospitals, government offices, and so on and includes service encounters. Therefore, we need to thoroughly understand ordinary or casual conversation and be able to use it to operate effectively in society. This is why it is imperative for second language learners to be familiar with the intricacies of ordinary conversation so they can have access to the target language community and become social participants in that community.

WHAT IS AT PLAY IN CONVERSATION?

Conversation is not just an exchange of words. It also involves body language (ie. kinesics) such as facial expressions, head movements, and gestures, as well as proxemics or distance between conversationalists, prosody such as rhythm, intonation, pitch and sentence stress, and finally norms of interaction which operate at the unconscious level. All the paralinguistics mentioned above as well as the norms of interaction can be culture specific and often are. According to Crozet (1996) the norms of interaction which require special attention in language teaching are those which have highly culturally specific components, so I shall refer to them as sociocultural norms. These sociocultural norms are found for instance in openings and closings, turn-taking and the use of silence, making, accepting and rejecting an invitation, and so on. It is because of the above that Conversation Analysis is especially useful in teaching conversation as to quote Button and Lee (1987):

Conversation Analysis is concerned [with studying] the social organisation of natural language-in-use. The concern is with the study of the activities or doings of conversationalists and with the means whereby they achieve order and organisation where they may be observed to have so achieved it.

(Button and Lee 1987:2):

In conversation, the relationship between participants (that is social distance and status), their intentions and the external context in which the interaction is held also play a part. Conversation Analysis does not
concern itself with all of this but pragmatics does, in particular politeness theory as formulated by Brown and Levinson (1987). So, I would like to include as part of the sociocultural norms the notion of politeness which can be viewed from two angles: positive and negative politeness. Positive politeness is roughly the expression of solidarity, whereas negative politeness is roughly the expression of restraint, of not imposing.

**RATIONALE FOR CREATING A COURSEBOOK TO TEACH CONVERSATION**

ESL teachers have expressed a number of concerns in teaching conversation, and the creation of the proposed coursebook is intended to address the difficulties outlined in the following sections. These difficulties tend to result from the lack of a theoretical framework and the fact that conversation is a complex phenomenon, a complexity not always fully appreciated in the field of education.

**Lack of theoretical framework**

The teaching of conversation is not generally based on a particular theoretical framework but rather on the teaching of conversational strategies and/or the use of communicative activities which often result in the language teacher having an *ad hoc* approach. Because the ESL teacher is not given a firm direction as to what needs to be taught in spoken interaction, teaching conversation is often equated with making students talk. Therefore, s/he tends to rely on a range of communicative activities such as role-plays, games, etc. and her/his own imagination, as well as a selection of activities from various coursebooks, which is not always a satisfactory teaching methodology. Conversation is very complex and usually coursebooks do not provide a detailed explanation and description of the phenomena of spoken interaction which Conversation Analysis succeeds in capturing. As a result, the language teacher may find teaching conversation a daunting and perplexing task; as one of my colleagues commented: “I don’t want to teach conversation, I wouldn’t know where to start.”

**Making students talk**

Another difficulty faced by the ESL teacher is how to make students talk especially when the teacher has tried a number of activities and has run
Teaching Language, Teaching Culture

out of ideas. By talking about conversational features and placing them in a cross-cultural perspective (which is dealt with in more detail below), teachers will no longer be confronted with this problem.

The aim of the proposed coursebook

The proposed coursebook to teach conversation is based on the findings of Conversation Analysis but also takes pragmatics into account. It intends to explicate what conversation is about, by looking at the following:

- How conversation is orderly,
- How conversation is structured and organised,
- How utterances are sequentially placed,
- In what sort of context spoken interactions are taking place and how context is created by participants,
- What language conversationalists use (spoken grammar and idioms), how they interact, what activities they perform, and how they orient their talk to each other,
- What the relationship of the participants is, and how this influences their interaction,
- What sociocultural norms are used,
- How language and culture are interrelated,
- What paralinguistic features are used and what function they fulfill in the interaction.

TEACHING CONVERSATION: A COMPLEX PROCESS

Teaching conversation as opposed to just getting students to talk

The aim of the conversation class is more often than not to make students talk. However, just getting students to talk is not teaching them conversation. It is simply providing students with an opportunity to talk but no teaching of conversation is taking place. Students may be learning from using English but in doing so they are not taught how conversation works and how participants manage talk-in-interaction. They are doing no more than practising their English. Sometimes students are given
Focus on spoken grammar as opposed to written grammar

Often in the conversation class, the focus is mainly on linguistic form, but not necessarily on the grammar of spoken English which needs to be looked at and distinguished from written grammar. L2 learners should be made aware that there is such a thing as a grammar of spoken English which is different from written grammar. McCarthy and Carter (1995) advocate the teaching of spoken grammar and show that naturally occurring conversation has distinct syntactic features compared with written English. For instance, there is ellipsis of the subject, predicate and auxiliary as in “dunno”, “not a problem”, “never heard of it”, “wanna come?”, etc. In teaching conversation, we aim to make L2 learners sound natural and not like a bock, as this can be alienating. According to McCarthy and Carter (1995) students should be given a grammatical choice and informed that “certain grammatical forms, revealed by corpus-based scrutiny of spoken English, enable a greater degree of interpersonal and interactive language use...” (McCarthy and Carter 1995:207).

Focus on meaning and interaction as opposed to accuracy

The focus on the linguistic features of written grammar tends to become the only point of correction, neglecting the conversational features related to the interaction. Indeed, focussing simply on written-grammar accuracy ignores the fact that participants in talk-in-interaction also look for meaning rather than just grammatical accuracy. In fact, Conversation Analysis reveals that native-speakers also make a number of linguistic errors (which are performance errors) in the course of their interaction yet the participants are able to carry on their conversation. If the message conveyed by one of the participants is unclear, conversationalists have resources to deal with such communication problems through the use of repairs. There are different kinds of repairs, such as self-initiated self-repaired, other-initiated self-repaired or other-repaired etc. the first of these being the preferred type of repair and the latter two often taught as conversational strategies.
TEACHING CONVERSATION USING CONVERSATION ANALYSIS AND ASPECTS OF PRAGMATICS

To be able to teach conversation to second language learners as described in this paper, students must have achieved a minimum language level. For our own purposes, they need to have acquired the basic structures of the language before they are ready to look at spoken interaction in more detail. So we shall target the conversation class to lower-intermediate (ASLPR 1) and upwards. It must be noted that Conversation Analysis is used as the main framework for the coursebook and elements of pragmatics are included to explain politeness and the relationship between participants.

Teaching real life language

One primary concern in teaching language and especially conversation is the question of transferability of skills and knowledge. In other words, we want to make sure that what we teach is going to be used by students once they step into the real world. If we use authentic or unscripted conversations and teach naturally occurring language, that is the language that conversationists use in an ordinary everyday conversation, students will be better prepared for what they find outside the classroom. If what we teach is real life, then students will be able to transfer that knowledge into the real world. Widdowson (1978) raises this issue of transfer of ability, distinguishing between language in use or communicative language and usage or grammatical rules when he says:

It is likely to be easier to extend a knowledge of use into new situations and other kinds of discourse than it is to transfer a knowledge of usage, no matter how extensive, to an ability to use this knowledge in the actual business of communication.

(Widdowson 1978:17)

This point further reinforces the need to teach what is spoken in the street as opposed to an idealised and reconstructed version of language in use. This is another reason why Conversation Analysis is so pertinent in second or foreign language teaching because it only examines naturally occurring conversations and looks at the organisation of these and the social activities that take place.
The choice of topics in a multi-ethnic class: adopting a cross-cultural perspective

Selecting topics can be a headache in a multi-ethnic classroom. A number of issues arise such as: which topics are appropriate for the whole class, which ones are too sensitive, will students feel concerned by the topic selected, and will the topic be relevant to their needs? The cross-cultural perspective deals with these problems as students discuss the conversational features and the sociocultural norms studied in class in relation to both the target language and their L1. The following illustrates how the cross-cultural perspective addresses the issues mentioned above.

The cross-cultural perspective is concerned with highlighting cultural differences in conversational styles and norms of interaction between different cultures. However, it also gives L2 students an awareness not just of the divergences but also the similarities that may exist between the sociocultural norms of their own culture and those of the target language culture, and how the sociocultural norms are mapped onto the language. My own observations of L2 learners have shown that students do not always realize this kind of positive transfer into the target language.

Approaching conversation from a cross-cultural perspective gives students an opportunity to explore their own cultural identity and explain to some degree why they operate the way they do. It also shows respect for students’ cultural entity and enables second language learners to be valued for their differences. Students are always willing to contribute to this type of discussion as it is a matter that directly concerns them and is particularly relevant to their needs, since learners at some stage will have to interact with native-speakers of English. Moreover, the cross-cultural perspective may unveil some of the reasons for the communication difficulties students may have encountered, and they usually take this opportunity to relate incidents or stories that illustrate a point covered in the lesson.

I would like to stress that in highlighting cultural differences both Conversation Analysis and pragmatics are used, particularly the politeness theory elaborated by Brown and Levinson (1987), which has proved very helpful for more advanced learners (that is learners at ASLPR 2 and above).
Teaching Language, Teaching Culture

TEACHING METHODOLOGY

The teaching methodology has an iterative structure as the approach is exploratory and students are able to continuously refine their understanding of the concepts taught (refer to Figure 1). In the awareness raising phase, concepts drawn from Conversation Analysis are first observed from authentic or unscripted videoed conversations then explained. In the reflective phase, students discuss the concepts in relation to their experience of them in L2 as well as in L1, that is, how these concepts are or are not applied in their L1. At this point, the discussion becomes cross-cultural. In the experimental phase, students experience these concepts in pairs or small groups through role-plays or simulation activities.

As a result of this experimentation, students often discover new issues which may entail looking at new elements or concepts. These issues are raised during the introspective phase where an evaluation of students’ conversations (or analysis if the conversations are videoed) is conducted. The new elements are then discussed, which leads to exploring further the concepts that were initially taught. In addition, in the experimental phase, students may produce a pragmatic transfer from their L1 onto English which is first identified and evaluated during the introspective phase (for more information on pragmatic transfer or failure, see Kasper in press a and b). Students then reflect on this by contrasting L1 sociocultural norms with those of L2. In the cultural evaluation phase which follows, the reasons for the mismatch between the sociocultural norms of L1 and L2 are explored; this can be achieved by looking at politeness theory and how politeness is mapped onto the language (see Figure 1).

CONVERSATIONAL FEATURES AND SOCIOCULTURAL NORMS TO BE TAUGHT

Prosody

Prosody, that is intonation and sentence stress, needs to be taught as an integrated part of conversation. Prosody needs to be contextualized as it is an interactional phenomenon. Therefore, it cannot be studied in a
Awareness Raising Phase

- Observation of conversational and interactional features
- Teaching CA concepts
- Verbal -> Interaction <= Non verbal

Reflective Phase

- Students' experience with L2
- Cross-cultural discussion

Experimental Phase

- Students practise conversation
- Students experiment with language

Introspective Phase

- Evaluation/analysis of students' conversations
- Identification of pragmatic transfer from L1

Cultural Evaluation Phase

Figure 1: Teaching methodology
Teaching Language, Teaching Culture

dissected form away from the conversation from which it has been extracted. For instance, intonation is important on tag questions such as right? feedback tokens, assessments and turntaking, and it reflects the speakers’ feelings.

Kinesics

Body language or kinesics cannot be ignored in the conversation class as most communication is done non-verbally. Gaze and head movements are significant and not always interpreted or used similarly across cultures. Not only must emblematic gestures be taken into account but also iconic ones, as both types of gestures help decipher an interaction. Emblematic gestures are “culture specific and substitutes for words” or idioms according to Poyatos (1988:98)– gestures such as waving the hand to say goodbye – whereas iconic gestures are shaped in relation to what is being said (see Schegloff 1984).

Feedback tokens and assessments

Feedback tokens such as yeah and right and assessments such as fantastic, great, that’s bad, etc are important as they point to the listener role in the interaction. Intonation on these is crucial to understanding their varied functions, particularly in the case of feedback tokens (see Gardner 1995a, 1995b).

Teaching functions through the notions of adjacency pair and preference organisation

Adjacency pairs form an exchange in which the second part of the exchange (called the second pair part) is conditional upon the first part (called the first pair part) and is normally placed contiguously. Examples of adjacency pairs are greeting followed by greeting, request followed by grant or refusal and leave-taking followed by leave-taking. The notion of adjacency is useful because it helps to predict what should come next, since adjacency pairs are sequentially placed. However, if the second pair part of the adjacency pair is not provided then its absence indicates that there is something wrong in the interaction. Where the next action is something other than the second pair part, this next action may indicate something which needs to be dealt with before the second pair part can be provided.
The notion of 'adjacency pair' provides an explanation for the use of linguistic functions which have traditionally been listed but not explained; the focus has mainly been linguistic and not interactional.

Teaching just a list of functions is not satisfying for either the learners or the language teacher as proceeding in this way decontextualises the social activity and does not provide an explanation of: 1) how functions occur sequentially in spoken interaction, 2) how they are shaped and used, which is revealing of the sociocultural norms at play, 3) how and why they can be embedded in a presequence, which also reflects the sociocultural norms used, such as a pre-invitation or a pre-request, and 4) how to recognise and interpret a missing second pair part.

Lastly, teaching a list of functions does not prepare students for the variability of language-in-use found outside the classroom. However, the notion of 'adjacency pair' captures all the above and enables students to analyse the interaction to find out what is really happening. In addition, it shows that some adjacency pairs can be multifunctional depending on the context as, for instance, the pair *Lovely meeting you/Lovely meeting you*, which can be used as part of an introduction or as a leave-taking at the end of a conversation where an introduction has taken place.

Moreover, adjacency pairs are closely related to the preference organisation system that governs conversation, which further enhances their structural significance in spoken interaction. Preference organisation shows that participants orient their talk in a particular way depending on whether the second pair part of an adjacency pair is a preferred or a dispreferred response. For instance, the preferred response for an invitation is acceptance whereas the dispreferred response is a rejection. Preferred and dispreferred responses have different turn shapes. A preferred response comes immediately after the first pair part and is normally short and structurally simple, whereas a dispreferred response often comes after a delay, is usually longer and structurally more complex. The concepts of 'adjacency pair' and 'preference organisation' are exemplified in the following excerpts taken from two videoed authentic conversations which are briefly analysed. The first excerpt is between two native-speakers of English:
Teaching Language, Teaching Culture

Apology

1. M: Why're you at Footscray now ?
2. (0.3)

Apology: First pair part (FPP) → 3. R: Well, I came here to apologize ↑
4. for not bringing back my book .

Silence here. It is usually the sign of a dispreferred response.

'oh↓' is a newsmarker and here it also prefaces a dispreferred response.
The second pair part (SPP) is not provided, so the apology has not been accepted as yet. Instead, this lack of a second pair part occasions an insertion sequence whereby M is trying to establish why R has not returned his book yet and why he got the reminder notice a week late.

5. (0.5)
6. M: oh↓

7. (0.3)
8. R: <I got a letter from you yesterday ;
9. M: ("which book")
10. R: got a letter from you yesterday ;
11. M: <right> ;
12. R: saying :=

13. M: <you should've got it last week
14. actually ;=
15. R: <back was in my pigeon hole> well it
16. might've been there last week
17. M: I found it in my pigeon hole
18. <yesterday > ;=
19. M: <oh my god> ;
20. R: saying it was overdue :=
21. M: <right> ;=
22. R: =and I didn't even realize I'd
23. taken the book out of the
24. out of the SAC ;
25. (0.5)
26. M: <how could you> :=
27. R: ='cos this is my- hh it is my
28. coursebook .
29. (0.5)
30. M: <and I just assumed
31. I'd bought this coursebook
32. M: [↑]
33. R: along with the other students'
34. coursebooks :=
35. M: <right> ;=
36. R: <so I opened up the back cover
37. and there is the- the SAC ; (.)
38. you know ?=
39. M: <right> ;;

M is still not satisfied with R’s explanation so the interrogation continues. Indeed, R has not indicated which book he is talking about. It is only later that he mentions which book it is and that he has actually returned it at line 38.9
Once M understands the situation better, she wants to make sure that R has proceeded correctly in bringing his book back. She is concerned that the procedure of returning the book to the Self Access Centre may not have been respected, in which case it would mean extra work in retrieving the book or the possibility of losing the book, both of which she wants to avoid.

Laughter, a device often used in troubles-talk (see Jefferson 1984a). It’s R who initiates it and who continues laughing while M reciprocates it only very briefly. This suggests that R is experiencing some discomfort, that there is a some problem. End of the insertion sequence, line 65.

Acceptance of the apology: the SPP is given. In saying that everything should be fine, R wants to reassure M that the procedure has been duly respected. At line 69, M shows that she is fully satisfied with the procedure of bringing the book back and has accepted the apology.

Sociocultural norms: example of an invitation between non native speakers of English

The next excerpt comes from a conversation between three learners of English who were having a conversation in class. It is considered an authentic interaction as the students were not given any directives as to what they should talk about. At the start of the conversation, N (a Thai female student) introduces A (a new Swiss female student) to B (a Thai male student). I must add that N hardly knew A as the latter had just started an English course at the time of the conversation and certainly did not know B at all before the conversation.

38. R: -thing so I gave it
39. to [Andrew; (0.4)]=
40. M: [the pocket (...)<]
41. R: -to give back ;=
42. M: [-right ;]
43. R: -so you should’ve got it
44. back .
45. M: -er through Andrew ?=
46. R: -yes ; ((clears throat))
47. M: -haven’t seen Andrew .
48. R: -well he may’ve put- I
49. think he just put it in
50. the- in the box .
51. (0.5)
52. M: -right .=
53. R: -I hope so .(he told m)e=
54. M: [hh hope]
55. R: -he said S (h)ugh (h)ugh (h)ugh
56. M: [(h)ugh(h)ugh]
57. R: (h)ugh (h)ugh (h)ugh (h)ugh
58. (h)ugh (h)ugh (h)ugh (h)ugh
59. M: (I hope he took the car.)
60. [and it fit in the pocket.]=
61. of the loans’ box .
62. R: ([I told him to put the] car. back in the back=-
63. back .=
64. M: -okay .=
65. R: -in the back of the book ;=
67. R: -I think everything
68. should be fine .=
69. M: -all right .=
70. R: -yes yes .
Teaching Language, Teaching Culture

Invitation: FPP

Silence is a sign of a dispreferred response, i.e. a rejection (see Davidson 1984). No SPP is given so A hesitatingly reformulates her invitation.

The interturn gap is again preface a dispreferred response. The hesitation "u::h", followed by a hitch "tsk" and a filler "well" are all delay devices typical of a dispreferred response. No SPP is given in the following lines; the invitation is not taken up.

The problem in this unsuccessful interaction is not really a lack of function, as A can issue an invitation even though it is not quite grammatical, but the lack of sociocultural norms. In effect, A has not respected the sociocultural norms attached to English because: 1) she did not try to establish some common ground with the two invitees; and 2) she did not make a pre-invitation whereby the availability of the invitees is checked before making her invitation. That the inviter creates some affinity with her invitees before inviting them is imperative. Indeed, its absence accounts for the lack of response to her invitation indicating that there is some kind of problem with her invitation which produced embarrassment in all participants.

Other examples of norms of interaction which are are affected by socio-cultural differences include:
Anne-Marie Barroja-Rohan

- **Turn-taking and overlaps.** Turn-taking can be culture specific in terms of interturn gaps (pauses between turns), which can vary across cultures and the amount of overlap tolerated in different cultures. Turntaking is also very much linked to intonation as, for example, a level intonation contour may indicate that a speaker has more to say, or a falling intonation on acknowledgment tokens such as *right* and *okay* can denote a pre-closing.

- **Openings and closings.** Openings and closings are also governed by sociocultural norms. In Australian English, a typical opening is done with a greeting immediately followed by a health inquiry which is usually not a genuine one. In saying *How are you*, native speakers are not, generally speaking, really interested in one's health and in most cases do not want a detailed account of one's state of health. This typical opening is not necessarily true for all cultures. Furthermore, in English, closings are usually done with a pre-closing which often involves, for instance, either assessments such as *great* or *good* and/or acknowledgment tokens such as *okay* or *right* pronounced with a falling intonation before participants take leave of each other (for more details on closings see Button 1987).

**CONCLUSION**

Teaching conversation to L2 learners has traditionally taken the form of getting the students to talk. The new methodology outlined here draws on the findings of Conversation Analysis and aspects of pragmatics to incorporate both the critical features of spoken interaction and the sociocultural norms of interaction. Thus, this methodology provides the language teacher with a theoretical framework, a structure and a direction to teach conversation. It enables the language teacher to have a better understanding of the complexities of conversation and hence of the conversational features that need to be taught. Furthermore, it provides L2 learners with the means to analyse spoken interactions to make sense of what the interactants are doing, so that L2 learners can communicate more effectively in English. Knowing the sociocultural norms of the target language gives learners an entry point into the cultural attitude of that community. As the focus of the proposed methodology is not just linguistic but also interactional, students are better prepared to tackle new situations and cope with the language used outside the classroom. Finally,
the approach used in the proposed methodology could also be applied to foreign language teaching to minimise the cultural shock often experienced when first interacting with speakers of the target language.

NOTES

1 Paper presented at the 1996 ACTA-ATESOL (NT) National Conference and the 7th TESOL In Teacher Education Conference.

**APPENDIX: CONVERSATION ANALYSIS TRANSCRIPTION**

The conventions used in the transcriptions in relation to intonation contours are adapted from the Jefferson transcription system by Gardner (1995b). These conventions are:

- full fall
- slight fall
- level
- slight rise
- medium rise
- ? full rise

The remaining items are the Jefferson conventions:

= latching indicates continuous stretch of talk
[ ] indicates simultaneous talk
yeah the colon indicates lengthening of sound
nine o'clock the underline indicates sentence stress
- the hyphen indicates abrupt cut off or glottal stop
*"it's okay* the degree sign indicates talk that is softer than the surrounding talk
*"species* the double degree sign indicates unvoiced talk
↓ indicates a shift in pitch going down
↑ indicates a shift in pitch going up
( ) indicates a very short pause or micropause
(0.5) indicates the length of the silence in seconds in relation to the surrounding talk
Teaching Language, Teaching Culture

>anyway< the signs > < indicate talk that is faster than the surrounding talk

< any way the sign < at the beginning indicates talk that starts quickly
< maybe> the signs < > indicates talk that is slower than its surrounding talk

huh indicates laughter
(h)uh (h) indicates plosive quality
hh h's indicate audible aspirations
$that's a pity$ the $ sign indicates laughing while talking
((clears throat)) the double brackets indicate co-activity relevant to the interaction
((.........)) indicates talk that is not clearly audible

USING CONTRASTIVE RHETORIC
TO TEACH WRITING: SEVEN PRINCIPLES

Andy Kirkpatrick
Curtin University of Technology

INTRODUCTION

Since the publication in 1966 of Kaplan's seminal article 'Cultural Thought Patterns in Inter-cultural Education' in which he proposed that rhetorical patterns and the ways writers shape paragraphs shape and organise texts were culturally specific, a number of studies have been undertaken in an attempt to prove or disprove the proposition. Kaplan's paper stemmed from his analysis of a corpus of English compositions written by native speakers of languages other than English. The corpus showed that there were problems that seemed to be both systematic and unique to speakers of particular languages. For example, in a much quoted passage, he suggested that in some 'Oriental' writing the expository paragraph developed by "turning and turning in a widening gyre" (Kaplan 1966:10), but in English followed a linear sequence with a paragraph normally beginning with a topic statement which was then supported by examples or illustrations.

The motivation for this early work in Contrastive Rhetoric was pedagogic. "At this stage in the evolution of contrastive rhetoric there was no great interest in understanding the origins of the matters under study, rather, the interest was primarily in finding solutions to an immediate pedagogical problem" (Kaplan 1988:277). This also helps explain why these early studies in contrastive rhetoric focused on the English writing of these students rather than on their writing in their Ll.
Teaching Language, Teaching Culture

This awakening of interest in Contrastive Rhetoric studies developed naturally from the interest and faith in Contrastive Analysis that had begun in the States in the late fifties and early sixties. Contrastive Analysis was based on the belief that linguistic differences between the target language and the first language would be difficult for students to learn and that similarities between the two languages would be easy for them. The first was called negative transfer, the second positive transfer so “What the student has to learn equals the sum of the differences established by contrastive analysis” (Banathy et al. 1996:37 and cited by Jackson 1981). Contrastive Rhetoric extended this to encompass rhetorical structure and viewed the student’s problem in writing in a second language as one of negative transfer (Matsuda 1997). In summing up 25 years of Contrastive Rhetoric, Leki (1991) reports that it is in writing classes that Contrastive Rhetoric has been seen to have the greatest potential value.

Over the years, Contrastive Analysis has restricted its claims to being able solely to predict potential causes of student difficulty and error and Contrastive Rhetoric has similarly softened its claims. Nonetheless, it emerges clearly that writing is a culturally variable activity and successful writing in a language goes beyond a command of the grammar and lexicon of the language. In this chapter, we will investigate the potential uses of Contrastive Rhetoric in the teaching of writing by itemising a number of principles that need to be considered to ensure that the Contrastive Rhetoric is appropriately undertaken and its results appropriately used.

PRINCIPLES

Principle 1: Rhetorical style in Language A can only be discovered by studying authentic texts in Language A

It was after studying the English writing of international students whose first language was not English that Kaplan proposed that writers of different languages structure texts in systematically different ways. He did not study texts written by those students in their first language. Hinds (1983), while acknowledging the importance of Kaplan’s work, has argued that, in order to identify paragraph and text structures that are
language specific, essays written in a particular language for an audience that speak that language should be analysed. Hinds’ (1983) advice should become the first principle for all people engaged in the study of Contrastive Rhetoric.

It is dangerous to make assumptions about the way texts are structured in an L1 from studying L2 texts written by speakers of the L1. We would, I think, be suspicious of the findings of a Chinese scholar who claimed, on the strength of analysing the Chinese writing of English-speaking students, that ‘Anglo’ styles of rhetoric were evident in the Chinese writing of the students. Kaplan’s 1966 article has met with much criticism on this score. For example, Mohan and Lo (1985) provide evidence that not all Chinese writing is circular. They give an example of a deductive paragraph taken from the Analects and quote several Chinese books on composition in which students are taught the importance of each paragraph containing a main idea. For the same reason, we must be cautious of Kaplan’s (1972) claim that a traditional Chinese essay style, the so-called eight-legged essay, still exerts an influence on the writing in English of Chinese students (Kirkpatrick in press).

More recently, Kaplan (1987) has stated that he now believes that all of the models of paragraph development that he identified in his 1966 article are possible in each language but that each language has a clear preference. Languages and their writers are versatile and can use different rhetorical patterns for different communicative purposes. An example of this operating at the level of sentence can make this clear. In Modern Standard Chinese, for example, the normal unmarked clause order in complex sentences is subordinate clause before main clause, while the opposite sequence is the preferred sequence in English (Kirkpatrick 1996). Chinese, however, can employ a main to subordinate sequence and English can employ a subordinate to main sequence. The decision writers take upon which sequence to use will depend on variables such as the communicative effect they wish to achieve or which aspect of an argument they wish to highlight. It would be very hard to detect this natural versatility of language simply by analysing texts written in the
students’ L2. Authentic texts in the relevant language must be studied to discover how writers of languages employ rhetorical structures.

Principle 2: Contrast like with like

Literacy is complex, diverse and culturally influenced. Even within a defined discourse community such as a university, text types are characterised by their diversity. Bernstein (1977) defines an academic discipline as a set of practices through which students learn to work within a received frame. One discipline is distinguished from another by using a different set of practices. Cross-disciplinary differences have been well-documented (Becher 1989) and there are several levels of disciplinary dialects operating in a university (Taylor 1978). Discourse communities are exceedingly complex. As Scollon argues, an individual has to learn how to communicate and find an identity “within a matrix of . . . multiple and competing systems of discourse” (Scollon 1996:10). This complexity is mirrored in all cultures. Liddicoat (1997a), for example, has shown that there are marked differences in style between French literary and scientific texts.

It is therefore important to establish complementarity between the text being studied in the L1 and the use of that type of text in the L2 if the aim is to use the results of the Contrastive Rhetoric for pedagogic purposes. We need to be sure that we are comparing like with like and to be aware, as we shall see below, that particular text types and styles may have different uses in different cultures.

Principle 3: Texts are written by people for people

In the potentially rather dry work of the analysis of texts, it is all too easy to forget that texts are written by people and for people. Those working in the field of Contrastive Rhetoric must first remember that individual writers can imbue any text with a personal and idiosyncratic style, and second that all texts are written for an audience of one sort or another and that the audience can play a role in the shaping of any text.

Argumentation is a social, intellectual, verbal activity serving to justify or refute an opinion, consisting of a constellation of statements and directed towards obtaining the approbation of an audience.
Andy Kirkpatrick

An important audience variable concerns the relative status of the writer and the audience. This was aptly summarised by Laswell some fifty years ago:

When non democratic attitudes prevail in a community, initiatives from below are phrased in a somewhat laboured language. Elaborate words and gestures are used by a subordinate to show that he is not presuming to transgress the prerogatives of his superior. By contrast with the self assurance of the superior, he represents himself as somewhat uncertain of judgement

(Laswell and Dwight 1949:30-31).

Much the same point was made over 2000 years earlier by the Chinese philosopher, Gui Guzi:

Yang (ie. persuading from above to below) encourages straightforward speaking. Yin (ie. persuading from below to above) encourages speaking in forked tongue.

(Tsao Ding-ren 1985:103)

The role of the audience and the relative status of the reader in comparison to the writer influences more than just choice of words. In his classification of contemporary Chinese documents, Dai Lei (1988) distinguishes three types of official document that are distinguished by the relationship between the writer and the reader. Documents written by superiors to inferiors are called xiaxing gongwen (downward documents); those written among equals pingxing gongwen (level documents); and those written by inferiors to superiors shangxing gongwen (upward documents). 'Downward documents' are abrupt. One might even call them deductive. 'Upward documents' tend to preface their main point or suggestion with a series of justifications for the main point. One might call them inductive (Kirkpatrick 1995).

In addition to knowing for whom any text is intended, the contrastive rhetorician needs to know something about the background of the author and the effect that author wishes to create. Wang Chong, the enfant terrible of first century Chinese politics, deliberately used a deductive style to outrage his political opponents (Wu 1988, Kirkpatrick 1995). Eggington (1987) has shown that Korean academic writing can
vary depending on the international experience of the writer. Koreans educated in the United States write academic Korean differently from those who have never left Korea. It is important, therefore, for the researcher to establish the intended audience and the cultural authenticity and communicative purpose of the text being considered.

**Principle 4: Prescriptive manuals can be wrong**

No one would seriously argue that the deductive essay was the only possible American essay style. Yet Scollon (1991) has shown that the American essay as taught in textbooks on composition is uniformly deductive. Ramanathan and Kaplan (1996) examined ten rhetorically oriented freshman composition textbooks and isolated eight common assumptions that these textbooks made about the ideal composition. The first assumption they identified was that the linear thesis-driven model of writing is universal. Ramanathan and Kaplan then point out that the eight key points presented in these textbooks are all culturally decontextualised and make no reference to discipline specific writing. In a rejoinder, Raines and Zamel (1997) state that in their classes most students do not specialise in a particular discipline until after at least a year and a half’s study and that therefore their writing classes cannot be discipline specific. This rejoinder serves as a telling reminder of the significant differences in so-called ‘Anglo’ educational traditions and that one should therefore make Australian–American comparisons with care.

Traditional notions of what comprises the expected norm in the reading and writing requirements of university students also need to be treated with caution. Recent research into academic reading and writing practices at Australian universities demonstrate that the traditional notion that Australian students need to be critically active is not the case across a number of disciplines (Reid, Kirkpatrick and Mulligan 1997). Indeed critical and wide reading is not encouraged, except in the social science disciplines. Much of the learning seems anchored at the reproductive end of Ballard and Clanchy’s reproductive – analytical – speculative learning continuum (Ballard and Clanchy 1991) and seem to parallel so-called Asian learning styles (Cortazzi 1990), although there is increasing evidence that traditional notions of ‘Asian’ learning styles are also wide
Principle 5: Writers need models

Proponents of process writing criticise Contrastive Rhetoric as being product rather than process oriented (Leki 1991). As Leki also points out, there is a prescriptive aspect to the Contrastive Rhetoric approach that sounds like "In English we write like this; those who would write well in English must look at this pattern and imitate it" (Leki 1991:123). Proponents of process writing are, in turn, criticised by advocates of Contrastive Rhetoric for adopting an approach that encourages students to discover form in the process of writing and that this represents "a significant part of the problem faced by students from non-US cultures" (Ramanathan and Kaplan 1996:22).

We shall have more to say about the development of process writing as a pedagogical method below, but here will address the tension between the two sides exemplified above. Models are important for student writers but appropriate and accurate models can be difficult to identify for several reasons. First, we have argued that texts within culture and discipline are varied and that prescriptive manuals are often guilty of presenting over-simplified or even inaccurate information. Second, we need to remember that students from the same culture who are transferring from secondary to tertiary education also experience difficulties in learning how to write in ways that are accepted by their lecturers as appropriate. Yet it is seldom that the expected ways of writing are made explicit or taught at universities. Content lecturers, by and large, have a mistaken view of literacy, believing it to be something definable and finite that students should have learned before coming to university. Lecturers see their role as teaching the content of a subject. They do not see it as their task to teach students how to present that content in disciplinary and culturally appropriate forms (Kirkpatrick and Mulligan 1996).

All these factors conspire to make it difficult for students and writing teachers to identify an appropriate model. But in order to teach writing we must know what writing to teach. The product being demonstrated as a model must be an accurate model and this is as true within culture as it is across culture. This approach need not become...
Teaching Language, Teaching Culture

overly prescriptive in the way characterised by Leki above. The model acts as a guide. Writers are individuals and have individual voices and ways of expressing their individual voice, even within the driest of academic texts, need to be explored. This should be process writing’s role. Process writing should encourage students to explore the possibilities of transferring onto the L2 text those cultural and individual constructs with which they feel happy, in such a way that they enhance their L2 texts rather than make them indecipherable for the assessor of the text. We cannot, however, expect students to discover the form of an acceptable product through process writing. They need to have appropriate models to guide them. A person who has never seen a watch would be hard put to make one even if provided with all the individual pieces.

Principle 6: Everyone needs practice

Leki asks: “What are writing teachers to do with the information that cultures approach writing differently?” (Leki 1991:137). Knowing that cultures approach writing differently is not enough to make a person write well in all contexts in all cultures. We all need practice, even those of us who are operating within our own cultures. We have seen how complex a discourse community is. Learning how to communicate effectively in writing within and across disciplines and for a wide variety of audiences is a skill that needs constant practice. No one wakes up one morning and finds that they are suddenly utterly literate in their own culture. This basic fact should be drummed into students and lecturers alike. The most accomplished writers painstakingly draft and redraft their work, responding to the comments and criticism of friends and colleagues. So it is important then that our students understand the nature of literacy and realise that even their teachers have to work hard on improving their own literacy skills. Literacy must be seen in the broadest of terms:

A prime task for any university teacher must still be to assist the development of competent human beings who will be motivated to continue using and refining throughout their lives the potential skills they acquire. . . . To be effectively literate is not only to have gained a certain competency in reading and writing, but also to go on exercising the habits, attitudes, know-how and values that equip a person to act on the language rather than just be acted on by it.

(Reid 1997:71)
Perhaps another answer to the question asked by Leki above is that an understanding that cultures approach writing differently should be passed on to the academic community in general. It is curious that courses in contrastive rhetoric are taught only to students rather than to lecturers and assessors of writing. Any university that claims to be international and to have ‘internationalised’ its curriculum needs to have academic staff who have an international and cross-cultural perspective of educational traditions and writing practices.

Principle 7: Change is constant

Many Australian universities currently adopt a ‘communication in context’ approach and place the teaching of generic writing skills either within or alongside the teaching discipline specific writing. Yet, Liddicoat (1997b) is right to express concern that, although students are being taught how to write texts within a specialised disciplinary framework, these texts are also culturally specific texts. In other words, a text is not only fashioned by a discipline, it is also fashioned by a culture.

Some students may willingly accept that they need to learn to write in different ways for different disciplines but may baulk at the required cultural style. It is common for students from non-Anglo cultures to complain that Anglo rhetorical patterns and styles, encapsulated in the aphorism “Tell ‘em what you’re going to tell ‘em, tell ‘em, tell ‘em what you’ve told ‘em” (Hinds 1987:144), are too simple and do not give them the chance to express themselves. It is often easy to use terms that denigrate the writing of other cultures, even though this denigration may be subconscious. Let us take the word ‘digressive’ as an example of an ideologically loaded term. Digression is valued in some French academic writing (Liddicoat 1997b), but the English learner of French may not accept this as the very word ‘digressive’ carries a negative connotation in English. Presenting arguments before making the main point is valued in Chinese rhetoric but this style may be considered long-winded in English (Kirkpatrick 1995).

Clyne (1987) has described cultural differences in the organisation of German and French academic texts. Hinds (1987) has posited a new typology of languages, calling some reader responsible and others writer responsible. Writers of writer responsible texts are
Teaching Language, Teaching Culture

expected to make the texts as clear and as easy to follow as possible. Writers do this by making much use of conjunctions and connectors and explicitly stating their argument, conclusion and point of view. Writers of reader responsible texts, on the other hand, expect their readers to work in order to make sense of their argument. Consequently such texts are characterised by lack of explicitness and a relatively infrequent use of connectors. Readers in reader responsible cultures expect to have to work hard to make sense of a writer's argument.

Hinds gives Japanese as an example of a reader responsible language and quotes Yoshikawa:

What is often verbally expressed and what is actually intended are two different things. . . . What is not verbally expressed counts most. . . . Although it is not expressed verbally you are expected to know it by kan - intuition.

(Yoshikawa 1978:144).

We have agreed that if we need to teach writing then we must know what writing to teach and we have seen that, given the complexity involved in cultural and disciplinary differences, this is not an easy task. The task is made no easier by the knowledge that cultures are dynamic and what is valued by a culture can therefore change. An illuminating example of such a change in cultural values is provided in an essay on the history of basic writing programs in the United States (Collins 1993). He charts the change from when writing was taught by tenured middle-class white males in Departments of English where learning how to write involved mostly middle class students writing with or against texts of the accepted canon, from Plato to Hemingway.

By the late 1980's, however, the teaching of writing had moved out of the English Department and into a writing programme and had become the province of poorly paid females on insecure short-term contracts. The student body had also changed dramatically with the increase of minority students whose own variety of English was not white middle-class or who spoke English as a second language. It was, Collins argues, in this atmosphere that process writing became popular. The canon had disappeared and there was a turn to discipline-based rhetorics. No canon meant no easily identifiable models. At the same
time the students were often unfamiliar with the demands of academic writing:

Unfamiliar or unpracticed with the essay formats characteristic of academic writing, basic students must first learn to write narratives, beginning with personal experience and working outwards to a public domain.

(Collins 1993:169)

Whether one agrees with this explanation of the development of process writing or not, many Australian readers will find much to identify with in this account. It serves to underline that the uses of literacy and what is valued as good literacy practice reflect changes in society. We need to be aware of this social dimension of literacy.

Valued and preferred styles change with the times. To understand these changes, we need to undertake studies in Contrastive Rhetoric that are culturally sensitive. So, if we want to learn about how writing works in different cultures we would do well to listen to Liu, who, in the context of Asian rhetorics, complains that “US based comparative rhetoricians show little interest in knowing how Asian rhetorical traditions have been conceptualised by Asian scholars themselves and within their native contexts” (Liu 1996:4). By knowing, for example, that the Chinese rhetorical tradition of the eight-legged essay has been looked down upon by the majority of Chinese scholars, Western scholars of contrastive rhetoric might not have been so quick to claim that it has influenced the contemporary writing in English of Chinese students. The following is a typical quote:

In any consideration of the qualities of the eight-legged essay, we must not forget it was the epitome of servile literature; we cannot regard it simply as a form of composition.

(Shu Wu 1993:85).

CONCLUSION

Teaching writing well depends on recognising that cultural expectations about how texts are written are as important as grammar and vocabulary. Contrastive rhetoric can be a useful approach for teaching this aspect of writing because it recognises that writers organise their texts in culturally
Teaching Language, Teaching Culture

specific ways. However, good language teaching requires good research. The results of studies in contrastive rhetoric can be of great value to teachers of writing, and contrastive studies of academic writing, whether they be across discipline or across culture or both, can be of great value to all academics. Such studies, however, need to ensure they follow the principles outlined above if their findings are to be of value to writing teachers and academics.

Teaching Language, Teaching Culture

CULTURAL TRANSMISSION IN LITERACY ACQUISITION:
A CASE STUDY IN CHINESE

Judy W.Y. Ho
Lingnan College, Hong Kong

INTRODUCTION

Children learn to become members of their individual cultures at an early age through the process of socialization, and many studies have shown that language plays a vital part in this process. While some researchers focus on the development of children's spoken language as a process of learning how to mean, and how to interact appropriately with members of the same culture (Halliday 1975; Wells 1981), others examine the close relationship between literacy development and the socio-cultural context in which the written language is learned (Heath 1983; Gee 1990; Freebody and Welch 1993). In particular, much interest has been generated in the role which first reading materials play in the process of socialization (Freebody and Baker 1987; Baker and Freebody 1989; Luke 1988). The present study focuses on how culture is transmitted through the written language, on how children are socialized to accept the characteristics of a specific culture while they are learning to read in the language of that culture. Some of the reading materials for first graders which are used in school and at home in Hong Kong will be examined. The lexis, grammar and discourse structure will be analysed to see how the Chinese social order is organized and what role the child plays in this order. Particular attention will be paid to these aspects of culture: concept of the self, family and kinship structure, social hierarchy, and beliefs and values.

THE CORPUS

The corpus consists of six Chinese school textbooks; and six Chinese story books, which are commonly read outside the school.
Teaching Language, Teaching Culture

The textbooks are published locally, approved by the Hong Kong Education Department, and widely used by the primary schools in Hong Kong. Each textbook is composed of 28-30 units. Each unit begins with a short text, usually narrative, but occasionally expository or literary in nature. This is followed by reading comprehension, extensive language practice and various language activities. The present analysis is based on the texts (a total of 176) only.

The story books were selected on a single visit to a major urban library in Hong Kong. All of them satisfied the following criteria which had been set before the visit:

- the genre is narrative
  All the books were written in the narrative genre which is appropriate for the present study. As noted by a number of scholars, the narrative plays a powerful role in childhood socialization (Miller et al 1990:294-295) and it is a discourse structure or genre which reflects culture. (Cortazzi 1993:101)

- focus on the culture studied
  All the books were written in Chinese. Books that were translated from non-Chinese languages were excluded.

- distinctiveness of the culture studied
  All the books were locally written and published. Books from Taiwan or Mainland China were excluded.

- popularity
  The loan record was checked. The number of times these books were lent out and presumably read at home exceeded 12 in the last months. This excluded the time when the books were read in the library. As a matter of fact, two to four copies of each of these books were provided in the same library but only the record on one copy was counted.

Details of the textbooks and story books are given in Appendix 1 and Appendix 2 respectively.

THE SELF, FAMILY AND KINSHIP STRUCTURE

A number of scholars have noted the differences in perception between the Chinese and the West of the concept of the self. In the West, the study of “self” has focussed on the concept of “personality” which refers primarily
to what goes on inside the individual. This is in great contrast to the Chinese concept of yun (jen/ren) which is based on the individual's transactions with his/her fellow human beings. (Hsu 1985; Chu 1985; King and Bond 1985) The language used in the texts under study illustrates this point clearly. First, they are marked by relatively little use of personal names. Instead, kinship terms abound in most texts. (See Table 1 below.)

Table 1: Use of Personal Names and Kinship Terms in Textbooks

The table compares the total number of personal name tokens and the total number of kinship term tokens found in the texts. With the exception of Modern Chinese Language 1B, kinship terms appear at a substantially higher frequency rate than personal names (from two-thirds higher to over four times higher). There seems to be a strong preference for identification of and relationship with family members and kinsmen over identification of individuals in these reading materials.

In all the texts, individual kinship terms which appear most frequently are those related to the immediate family, which is presented as the core of the child's world. The numbers below refer to the numbers of tokens found.

Teaching Language, Teaching Culture

This relative insignificance of personal names and the pervasiveness of kinship terms are also found in the story books. With the exception of Daai Hung’s Shoes and Clever Bui-Bui, we do not find any personal names. In the Wanderings of the Little Duck, only a kinship term is used for the protagonist: the little duck is referred to as ‘Little Younger Brother’ 小弟弟 throughout the story. In other stories, the protagonists are referred to by their generic terms. For example, in The Naughty Little Angel, we do not know the angel’s name. He is referred to as ‘Little Angel’ 小天使 throughout the narrative. In The Moonlight Lake By Night, the main character is a personified swan. She is called Swan throughout. In fact, all the story books adopt a naming system which is found to be quite common in Chinese children’s stories - a combination of generic term and kinship term as in Examples 1-3.

Example 1

兔 媽媽
iou maa-maa
rabbit mother = Mother Rabbit

牛 伯伯
ngou baak-baak
cow father’s elder brother = Uncle Cow

雀 李叔叔
zeek suk-suk
bird father’s younger brother = Uncle Bird

鹅 大嫂
ngo daai-sou
goose eldest brother’s wife = Sister-in-law Goose

雞 妹嫂
gai ji-jii
hen mother’s younger sister = Auntie Hen

(Thi Rabbit and the Weeds)

Example 2

鴨 媽媽
aap maa-maa
duck mother = Mother Duck

鴨 媽媽
ngo maa-maa
goose mother = Mother Goose

(The Wanderings of the Little Duck)

Example 3

獅 李叔叔
si suk-suk
lion father’s younger brother = Uncle Lion

(Clever Bui-Bui)
A similar naming system is found in the personification of inanimate objects in the school textbooks. A category term is combined with a kinship term to form a special way of address or reference as in Examples 4 and 5:

Example 4

雲 姐姐
wan ze-ze
cloud elder sister = Sister Cloud

雷 公公
leot gung-gung
thunder mother's father = Grandpa Thunder

(Lesson 25, [Kai Si] Chinese Language 1A)

Example 5

冬 妹妹
ding mui-mui
winter younger sister = Sister Winter

(Lesson 28, Modern Chinese Language 1A)

It is obvious that when Chinese children are learning to read in school and at home, they learn to acquire the culture that is embodied in these kinship terms. They learn from an early stage that family members and kinsmen are an inseparable part of one's life. The fact that personal names are not emphasized in primary school textbooks and home reading materials reflects a very important aspect of early socialization. The self is seen as being in relation to significant others. Chu (1985:253) defines “significant others” as “individuals in the self’s social environment with whom he constantly interacts in various kinds of role relations.” These “role relations” are of prime importance in the Chinese culture. In the Confucian framework, they are defined as the Five Cardinal Relations, namely, those between

1) sovereign and subject,
2) father and son,
3) elder and younger brother,
4) husband and wife,
5) friend and friend.

(King and Bond 1985: 33-36)

Since the textbooks which we are looking at focus on 2), 3) and 5), I will limit my discussion to these three. But it is to be noted that 1) the relation between sovereign and subject has often been expounded in terms of 2),
i.e. the ruler (the emperor in ancient times, or the government in modern times,) should look after his people as a benevolent father; whereas the ruled should be loyal to the ruler as a respectful child. Besides, 5) the relation between friend and friend has often been referred to in terms of 3). It is not unusual for close friends to call each other or refer to themselves as hing-dai 兄弟 or zi-mui 姊妹. This entails expectations of a moral obligation to help or receive help from one’s friends, as one would expect from one’s brothers and sisters. It is also to be noted that two important role relations seem to be excluded from the cardinal five: stranger and stranger, and, teacher and student. I will discuss the stranger-stranger relation first and then return to the teacher-student relation later when I talk about role expectations and responsibilities.

As we have just seen, role relations in Chinese are often expressed in kinship terms. Since the Chinese social order is based on the kinship system, it would seem very difficult for a Chinese person to establish a relationship with someone outside this kinship boundary. One way to overcome this difficulty is to expand the boundary temporarily to accommodate the stranger. In one of the school texts (given as Example 6 below), we find an illustration of establishing a culturally acceptable relationship with strangers through the kinship system:

Example 6
車子 上，人 要 多
ce-zi soeng, jan zan do
vehicle on people really many
'It was really crowded on the bus.'
一位 伯伯 看見 我，
jat wai baak-baak hon-gin ngo
one classifier father's elder brother see me
'I, a man saw me'
搖 來 搖 去 站 不 定，
jin loi jiu heoi zaam bai ding
sway come sway go stand not stable
'swaying to and fro and standing unsteadily.'
就把 座位 讓 給 我，
zau baa zo-wai joeng kap ngo
so handle seat give up to me
'so he gave up his seat to me.'
一會兒，
jat wui-ji
one moment
'A moment later,'
Here we see a big contrast in the way strangers are dealt with in the Chinese and translated versions. The English version shows no concern with the relationship between the child and those with whom he is interacting. But in the Chinese text, the generic terms are replaced by kinship terms. The stranger is assigned a temporary place in the kinship system. In fact, it is a common practice among Chinese to refer to and address strangers in kinship terms especially in situations where the contact is brief and the relationship is temporary, for example, in asking a stranger for the way, and in service encounters. Very young children are socialized to adopt this practice in the spoken language. As a general rule, a stranger’s correct place in the “relational hierarchy” (Chang and Holt 1994:105) is judged according to his/her perceived age. For example, in the park, when a toddler meets an older child whom he does not know, the younger child is usually taught to address the older child as go-go (elder brother) or ze-ze (elder sister). This practice of accommodating strangers temporarily in the kinship system is reinforced in the written language, as we have just seen in the school text.

**SOCIAL HIERARCHY**

So far we have observed that in the Chinese culture, the self is a relational being and the organization of relationships is embedded in the family system. Now let us look at what kind of relational organization it is and what roles are entailed in such an organization. The organization is vertical, or hierarchical in nature (Hwang 1987; Chang and Holt 1994). The language itself differentiates the position of each member in this social hierarchy in a very fine way. The age difference has to be shown. So specific kinship
Teaching Language, Teaching Culture

terms like “elder/younger brother” and “elder/younger sister”, instead of
general kinship terms like “brother” or “sister” are used in Chinese.

Even the order of birth must be shown. Hence there are discriminatory
ordinal kinship terms (e.g. 2nd Elder Brother, 3rd Younger Sister). At the
same time, the proximity of the kinship has to be shown. Therefore there
are different terms showing whether grandparents, uncles, aunts, cousins
are on the paternal or maternal side. In this social hierarchy, each person is
assigned a specific place. Children are taught to accept this hierarchical
nature of relation roles not only when they learn to speak and live as
members of the culture, but also as they learn to read and write as literate
members of that culture. Very often in children’s stories, main characters
are named according to their order of birth in the family. In the Rabbits and
the Weeds, the four rabbit brothers are called according to their birth order:

Example 7

大 兔
daai tou
eldest rabbit
daa"i go
eldest elder brother

二 兔
ji tou
second rabbit
ji go
second elder brother

三 兔
saam tou
third rabbit
saam go
third elder brother

四 兔
sei tou
fourth rabbit
sei go
fourth elder brother

At this point, I would like to return to the teacher-student relation
mentioned earlier. It is one of the most important jau relationships. There
is an old saying:

一日為師，
jai jai wai si
one day be teacher
終身為父。
zung san wai fu
all life be father
‘A person who has been one’s teacher (even) for (as short as) a day
will be (treated like) one’s father for as long as one lives.’

It explains the similarity seen to exist between a father-son relation
and a teacher-student relation: the same social roles are expected, i.e. those
in the superior positions or in authority are expected to possess the virtue

115
of benevolence by looking after the needs of those in the lower positions, giving them advice, guidance and direction. Those in the lower positions are supposed to show proper respect and deference to those in authority, by listening to their advice and satisfying their demands. Therefore, in the classroom, the teacher is perceived to be the authority figure who will look after her students and take charge whereas students are expected to learn from the teacher and listen to her. (Ho and Crookall 1995). Children are taught respect for the ordering of relations and submission to these fixed social roles throughout the socialization process but particularly after the age of 5. (Ho 1980 cited in King and Bond 1985:34) This is the age when they start to develop their literacy skills. Let us look at how this aspect of the culture is transmitted through the use of grammar and discourse structure.

**BELIEFS AND VALUES**

The school texts show the use of a salient aspect of grammar, modality, to reinforce the social roles and responsibilities expected of a child. When a virtue or desirable behaviour is referred to in the texts, a median - high modal operator is used, as in Examples 8 and 9 (emphasis mine).

**Example 8**

老師說：「好孩子不應該取笑別人。」
'Good children should not laugh at others.'

*(Lesson 25, Chinese Language 1A)*

**Example 9**

爸爸說：「你們專心做功課。」
'Father said, "You must concentrate on your homework."'

*(Lesson 27, Chinese Language 1A)*

Sometimes, a mode adjunct of intensity is attached to stress the importance of the proposition, as in Examples 10 and 11 (italics mine).

**Example 10**

丁丁想：「同學們都用心上課，代玩簡娃娃，真不應該。」
'Ding Ding thought: Other classmates are paying attention in class but I am playing with my glove-puppet. This really should not be done.'

*(Lesson 3, Chinese Language 1B)*
Teaching Language, Teaching Culture

Example 11
我要認真做暑期作業。
'I must seriously do my summer homework.'

(Lesson 28, Kai Si Chinese Language IA)

In contrast to texts involving social or moral behaviour, texts that encourage the child to maintain physical health are presented quite differently. No similar modal operators are employed. Instead, either a simple instruction is given with the positive condition marker "if" as in Example 12, or factual descriptions of what is done in the form of nursery rhyme and plain imperatives are used, as in Example 13.

Example 12
要想身體好，天天做早操。
'If you want to have good health, do morning exercises every day.....'

(Lesson 21, Chinese Language IA)

Example 13
好孩子，起得早，天天起來做早操。
彎彎腰，伸伸腿，勤做早操身體好。
'Good children get up early. Everyday they get up and do morning exercises. Bend your backs. Stretch your legs. Be diligent in doing morning exercises and your health will be good.'

(Lesson 9, (Kai Si) Chinese Language IA)

The difference in the choice of these grammatical elements reflects the preoccupation of the culture with values that are associated with moral behaviour and educational achievement (Wu and Tseng 1985; Wu 1994)

Now let us take a look at the discourse organisation of some texts to see how social roles are defined. As Scollon and Scollon (1995) have pointed out, a Chinese speaker usually adopts a "topic-comment" order of presentation in which "the main point (or comment) is deferred until sufficient backgrounding of the topic has been done." (Scollon and Scollon 1995:1) That is, the most central idea, or the most important information is often expressed towards the end. This relationship between discourse structure and cultural meaning is illustrated in Examples 14-16.

Example 14
媽媽正在忙著做飯，淘皮的弟弟卻哭著要媽媽和他玩。我對弟弟說：「弟弟乖，不要吵，我和你到外面去玩吧。」
Judy W.Y. Ho

媽 媽 稱 訴 我 說：「你 愛 護 弟 弟，又 能 賣 幫 助 我，真
是 我 的 好 孩 子。」

‘Mother was busy preparing the meal, but naughty Younger Brother
cried, whining that Mother play with him. I said to Brother, "Be
good, Brother. Don’t cry, I’ll take you out and play with you.”
Mother praised me, saying, "You love your brother, and you can
help me. You are really my good child."‘

(Lesson 11, Chinese Language 1B)

In this example, a familiar family scene in which a young child is
pestering a busy mother is presented. By depicting the elder child as the next
figure in authority within the relational hierarchy, and making him fulfill
the expected role of alleviating parental burden and looking after those
“below” him, a “good child” is defined as one who loves one’s younger
siblings (thus fulfilling one’s obligation of catering for the needs of those
under one’s authority) and helps one’s mother (thus fulfilling the obligation
of serving parents in filial piety). This definition is given at the end of the
text which normally carries the greatest significance.

Example 15

星期日，我們在 家 裏 媽 媽 做 家 務。
哥哥抹門窗，姐姐洗地板，我和弟弟、
妹妹抹桌椅，門窗、地板和桌椅都清潔了，
我們才休息，媽媽說：「你們都是好孩子。」

‘On Sunday, we helped Mother to do the housework at home. Elder
Brother wiped the doors and windows, Elder Sister washed the
floors, I and Younger Brother and Younger Sister wiped the tables
and chairs. We did not rest until all the doors and windows, floors,
and tables and chairs were cleaned. Mother said, “You are all good
children”.’

(Lesson 16, [Kai Si] Chinese Language 1A)

This example shows a family with Mother as the core and purpose
of the activity: the children gather together to help Mother with the
housework. The great efforts and dedication are emphasized in the children’s
refusal to rest before they accomplish their work. Again, their act of filial
piety is explicitly acknowledged in the final comment.

Example 16

上課的 時 候，老 師 對 我 們 說：「好 學 生，要 用 功 読 書，
留 心 聽 課。」 要 記 住 老 師 的 話， 做 個 好 學 生。
Teaching Language, Teaching Culture

‘While we were having a lesson, the teacher said to us “Good students must study hard and listen attentively to (explanations of lessons)”. I must remember the words of the teacher and be a good student.’

(Lesson 5, [Kai Si] Chinese Language 1A)

The teacher’s definition of “good students” is embedded in the highly valued virtue of diligence and the much expected student role of listening to the teacher and learning from her (as previously discussed). These values and expectations are consolidated in the student’s response which serves as a comment to the topic initiated by the teacher.

In these examples, the backgrounding is provided in the description of a child helping Mother to look after his younger brother, helping to do the housework, or studying hard. These are often seen as acts of filial piety or submission to the expectations of those in authority. But the comment, the main point is given in the last line of the text: an explicit approval of such acts of filial piety or submission to the demands of the authority, of the social roles that the children have fulfilled or are determined to fulfill. The topic-comment discourse organisation strongly suggests the cultural meanings of “being”: what it means to “be” a “good child”, what it means to “be” a “good student”.

Further examples (17-19) show how the topic-comment order is coupled with a metaphorical use of language to express the importance of role relations.

Example 17

明天就要開學了，爸爸送給我一個新書包。
新書包是深綠色的，上面畫著一隻米奇老鼠。米奇
老鼠正吹著一個大氣球，眼睛耳朵都很大，又可笑又
可愛。
明天就要開學了，爸爸送給我一個新書包。
新書包是深綠色的，上面畫著一隻米奇老鼠。米奇
‘Tomorrow school will begin. Father has given me a new schoolbag. The new school bag is deep green in colour. On it is drawn a Mickey Mouse. The Mickey Mouse is blowing up a big balloon. Both his eyes and ears are very big. He is both funny and lovely. I love my new schoolbag.’

(Lesson 1, Modern Chinese Language 1B)

The text begins with a context: start of the school year. Then the action follows: the father gives a schoolbag to his child who will need it for school.

119
Here the father, the authority figure, is seen to be fulfilling his role as the overseer of needs. At the same time, by attaching importance to an object associated with schooling, the father is indicating his demand on the son: he wants him to study hard at school. In a sense, the schoolbag is a symbol both of parental love and demand. The son is supposed to acknowledge his father's benevolent role and his own deferential role. The detailed descriptions of the lovely schoolbag may well be a way to emphasize this acknowledgement which reaches an explicit climax at the end of the text where the son indicates his love for the schoolbag. It is interesting to note that although the figure of the Mickey Mouse is a Western creation, the meaning of the whole text is essentially Chinese.

Example 18

我種了一棵小樹，我給它澆水，我給它除草。
小樹一天一天長大。
我是爸爸媽媽的小樹，爸爸媽媽給我吃得飽，
爸爸媽媽給我穿得暖，我也一天一天長大。

'I planted a little tree. I watered it. I weeded it. The little tree grew day by day. I am Father’s and Mother’s little tree. Father and Mother fuled me (with food), Father and Mother warmed me (with clothes), I also grow day by day.'

(Lesson 22, Chinese Language 1B)

The parallel construction of the two paragraphs and the use of the metaphor of the “little tree” are quite obvious. In reading this text, a child learns to accept the role of the authority figure as the overseer of needs. The concluding line implies a causal relationship. Children owe their growth, or even their very existence to the benevolence of their parents, in the same way as the little tree owes its to the child’s care. Therefore the self is seen not as an independent entity but rather a being dependent on the care of one’s parents. This is the basis of filial piety. Since one owes one’s existence and growth to one’s parents, one should give what is due to one’s parents - loyalty, obedience and deference.

Example 19

姐姐有...把美麗的花雨傘。
今天放學的時候，忽然下起雨來...姐姐來接我...她
用花雨傘遮著雨，不讓雨水淋濕我。
我喜歡下雨，我更喜歡姐姐打著美麗的花雨傘，
保護著我，接我回家去。
Teaching Language, Teaching Culture

‘My older sister has a beautiful floral umbrella. Today, when I finished school, it suddenly started to rain. Sister came to take me (home). She blocked the rain with her floral umbrella and would not let the rain pour onto me and make me wet. I like rain. I like Sister opening the beautiful floral umbrella, protecting me and taking me home.’

(Lesson 17, Chinese Language 1B)

This text shows the older sister as the benevolent figure both in the literal and symbolic sense. She looks after the need of her younger sister, and protects her from the rain. The rain does, of course refer to the physical downpour but it also strongly suggests the adversities in life. The umbrella, a symbol of the family bond which is the central bond in a child’s life and which is reinforced in the final image of homecoming, plays a significant role in the introduction, body and the conclusion of the narrative. In fact, it is the most important cohesive link in the narrative and helps the text evolve round a cultural theme.

CONCLUSION

I have shown in this study that one of the most important functions of literacy is to transmit values of a specific culture to those who are learning to become its members. In fact, one of the aims in providing a Chinese programme at school, as laid down in the Syllabuses for Primary Schools by the Hong Kong Curriculum Development Committee (1990:13) is to “cultivate students’ moral sense and enable them to acquire a knowledge of Chinese culture”. The present case study shows that children do not just learn how to decipher meaning from logographic symbols; they also learn to accept the values and beliefs of the Chinese culture which are embodied in the written language. The lexis, grammar, and discourse structure all teach the child how the Chinese social order is organized and how his or her part is placed in it. Culture is certainly transmitted but whether it is acquired is another matter.

NOTES

* This paper is the revised version of a paper presented at the 23rd International Systemic Functional Congress, University of Technology Sydney, July 15-19, 1996.
1. Kai Si, the transliteration of the first two characters of the Chinese title of the book is added in order to distinguish the books from the first two books in the table because both publishers use the same English translations of titles.
2. Throughout this paper, the Cantonese romanization system which was proposed and adopted by the Linguistic Society of Hong Kong in 1993 is used.

INTRODUCTION

When is a classroom not a classroom? Well, actually, it's always a classroom, and there doesn't seem to be much that we, as teachers, can do about that. If this means that the imperatives of classroom practice can overwhelm any attempt to introduce other practices into such a well-disciplined space, it follows that the demands we make on our students, and their attempts to respond adequately to those demands, will always be bound up with pedagogical stakes.

The question of how this might be taken up productively for a discussion of the vexed issue of language and culture teaching is the point of this paper. Using recent elaborations of the concept of genre, we seek to unpack some of the presuppositions entailed in the language/culture nexus, where it is too often assumed that to learn a language is to learn a culture, or (a variation on this) that to master a culture, one must first master the language. Language is not a specular manifestation of culture, any more than culture is a finished masterpiece. We will argue that cultures are made up of intersecting generic practices, some of which are language-based, many of which are not.

Our job as teachers of language and culture is to help students deal effectively with the requirements of different genres. This entails teaching
both the recognition of generic diversity, and the understanding that acquiring cultural skills is not like painting by numbers, where one follows the model subserviently until the last section is coloured in. More helpful might be the metaphor of the collage — open to additions and changes — where there is no complete, coherent picture, where not everything is visible, but where series of images overlap and interlock in not always predictable configurations, sometimes covering others, sometimes revealing a different perspective when set against the larger background. Part of our job as we see it is to teach our students to cut and paste, to engage with a complex system in evolution, rather than perceiving culture as a finished masterpiece, to be at best forged, at worst admired from afar. Effective language and culture teaching is not just about teaching generic rules, but showing how and where rules can usefully be broken.

We will take as an example a course taught for the first time by the University of Queensland and Queensland University of Technology in 1995. Called *French for Business* (already a problematic title), it was offered to students of both institutions and from different disciplinary backgrounds and took place in the Department of Romance Languages at the University of Queensland, although it was taught by staff from both institutions.¹

The course was comprised of three hours per week, each hour taught by a different member of staff. For the first hour of alternate weeks, students were to meet with and be addressed by a member of the francophone business community. What this meant (we thought), was that this hour would not count as a standard classroom hour. Our students would interact with the invited guests in a manner which respected the conventions of the French-speaking business world, including those of register, conversational substance and rhetoric. Students would also be asked to dress “in an appropriate fashion”.

When, in the first class of the semester, we told the students of our plans, their reactions were mixed. Some expressed surprise, others appeared stunned, or disturbed, and several objected vehemently. Unprepared for the strength of the reactions to the dress code, we were obliged to clarify our position and retreat to more moderate ground: we could not, of course, oblige anyone to do anything to which they had
strong objections, but a refusal to “be a team player” would somewhat defeat the purpose of the exercise, which was that the students should put into practice their hard-learned linguistic and cultural skills. The premise of the interrelation of those skills was perhaps taken too much for granted in our planning of the course, and the sudden need to justify it anew to students was disconcerting. The pedagogical strategies and aims of the course relied heavily on the assumption that cultural practices manifest themselves variously and locally — in language practices; in forms of dress and address; in administrative regimes and political manoeuvres, to name but a few — and that we needed to give our students an idea of the range of competencies necessary to getting by in a francophone business context. Clearly, we could never hope to cover the spectrum fully, but by engaging with its complexity and with some of the more noticeable aspects of the terrain, we might equip students with the tools to navigate relatively unscathed through the bumpier spots, and with enough sensitivity to the particularities of the business genre to move between conventions with a minimum of discomfort.²

Our attempt to get students to engage appropriating with the generic conventions of business, in French, was to be frustrated from the start, but not because the complexity of those conventions was beyond them. The difficulty lay in the co-existence of different generic requirements, those of the classroom and those of the business seminar, in the same place, and in our failures to deal with that generic mixity in a pedagogically useful way.

GENRE

Fixity/Mixity

The notion of genre we will adopt for the purposes of this paper assumes that generic mixity is the order of business in any event.³ Generic mixity must be understood on more than one level; not only does it mean that genres are not impervious to transformation, from within and from without; it also means that genre is not merely a category limited to the classification of texts, but pertains to the writing of texts and their interpretation, social practices and forms of interaction, and even to kinds
of linguistic performance; and finally that the notion of genre itself is flexible.

There is a clear classical tradition of regarding genre as normative and descriptive, where those two functions are mutually entailed. In this tradition, genres have representative members, which are representative because they conform perfectly to the genre in question. A text which fails to conform perfectly counts as imperfect. This notion of genre is thus circular, and ultimately unhelpful except as a tool of classification.

If however we adopt a notion of generic mixity, we find that it is possible to read a text (performance, interpretation) as belonging to more than one genre at the same time. The tensions produced by multiple generic gestures are one of the things that make a text interesting. Thus tension need not necessarily be thought of as negative. It can indeed be interpreted positively and productively. If *A la Recherche du Temps Perdu* did not simultaneously make claims on the genres of fiction and (auto)biography, it could not exist in the form in which it was written. Crucially dependant on both, it weaves a narrative about the story-telling in our lives and the lives in our story-telling which refuses to settle neatly into one or the other of those genres. Alternatively, if we think of the British Airways television advertisement which used the Flower Duet from *Lakmé*, it becomes clear that the desired impact on the consumer depended on the successful contamination of the publicity genre by the operatic, bringing with it a certain set of topoi normally associated with the opera (prestige, elegance, class, and so on). Similarly, our diagnosis of the *French for Business* course will reveal an interesting set of tensions stemming from different generic expectations. Whereas we took generic mixity for granted, there was a lingering desire on the part of some students for the certitudes of generic fixity.

**Genre in the classroom**

Why is genre crucial to our discussion of the teaching of language and culture? If we take the genres that inform our cultures to be flexible, multiform and permeable, with various and often incompatible stakes, it follows that there can be no such thing as a monoculture. Our cultures are multigenic things, fragmented and multifarious, in spite of turgid appeals to the nationalistic, unifying sense of "culture" we hear so often.
No national culture is unified by a single purpose, subordinate to a single political and social imperative, immune to marginal interests and contestations of cultural centrality. The generic practices which make up what counts as "a" culture are infinitely varied, such that to assume complete cultural competence is to imagine a person of infinite social flexibility, able to move comfortably and function adequately in the Pauline Hanson Fan Club and as spokesperson for ATSIC, socialise appropriately at Kirribilli House and at the local pub. This is not to say that such people do not exist. Indeed, we are used to seeing, and mistrusting, this kind of multigeneric ease in our politicians. It seems unnatural, because it can be difficult to accept that the social practices we take as central to our lives might in fact be purely conventional (learned forms of behaviour), and that those who can manipulate and manoeuvre amongst them might in fact be socially more successful people. Nonetheless, this multicultural ease is far from being the norm — even if many of us secretly aspire to it — and it is clearly beyond the scope of the language classroom. There are far too many genres to master, and there is no one right and proper place to start.

The kinds of generic skills required for business (or the hospitality industry, or engineering) are therefore teachable from introductory levels on. To assume that we need to wait until students have achieved advanced linguistic proficiency before they can integrate the "target culture" is to assume that they are not already learning cultural practices from Lesson One (cf. Crozet 1996:40). In French, for instance, learning the crucial distinction between tu and vous simultaneously marks a linguistic and a cultural particularity. To learn the linguistic skill is to learn a cultural skill, and to buy into a complex network of cultural hurdles (introductions, party etiquette, friendship rituals, differences of register pertaining to different social groups, etc.) organised around formal and informal address. The same applies to the teaching of French for professional/vocational purposes. Students can easily be taught the conventional "linguistic" skills of a standard beginners' course, while at the same time being sensitised to the ways in which those skills intersect with the practices particular to business culture. This would apply to the teaching of tu/vous. It would apply to greetings and introductions, to telephone etiquette, filling out forms, letter-writing, and so on. In this sense, therefore, language and culture are interrelated: certain generic practices manifest themselves linguistically.
Teaching Language, Teaching Culture

French for Business

French for Business thus teaches a set of generic practices (which might be described generically as skills for doing business). Ultimately, it was decided that we could not presume to cover the range of necessary skills thoroughly (even if we could determine exhaustively what those might be) and that we could at best try to foster the development of skills students could use to recognise the situations where they might be at a loss. We aimed to teach a certain generic sensitivity, which would involve being aware of differences of convention between anglophone and francophone business practices, and indeed between the world of business and the broader social context. Students might thus be expected to respond to new situations with enough adaptability to learn useful responses for the next such occasion.

Unfortunately, we presupposed that very capacity for generic flexibility in the classroom itself. As we noted earlier, students were somewhat thrown by the news that they would have to adapt to new and unusual circumstances in one segment of the course. That some of the students should have been panic-stricken ought to have been predictable, but that potential for alarm was obscured in our planning of the course by our desire for students to use their skills in a context other than that of the classroom. While assuming from the start that we would be teaching generically specific interrelations of linguistic and other cultural practices (as well we might for any French course), we nonetheless disregarded the heterogeneity of genres we were introducing into the same space. A vocational course such as French for Business was a new and unusual genre for most of our students, who were grappling with the generic difficulty of having French and Business co-exist in a single course. Being a new genre, it opened up a space for intersections of linguistic and other cultural practices not normally seen in the classroom. It also raised questions about language and culture to which not all the students were equally open. (To what kind of genre might this course belong? Which generic rules will it obey? Will it be a language course, or a business course?) It seems clear now that the physical environment (a Romance Languages department) was seen by many students to define this course as an exercise in linguistic competence. The introduction of "things to do with business" was sometimes taken as an intrusive foreign element, harmless insofar as they might be reduced to vocabulary acquisition.
Yet in addition to this breach of disciplinary boundaries, students were confronted with a breach of institutional boundaries when we brought private enterprise into the academy (a distinction fast disappearing from the Australian tertiary sector). While in any class students might be required to master a range of activities, and a diversity of genres (the essay, the report, the oral presentation, textual or statistical analysis, and so on), that diversity remains subordinate to the governing genre of the classroom with its institutionally sanctioned rewards. In the language classroom, this governing genre also acts as a safety net on language performance; here, mistakes are permissible, even expected. Indeed, the necessary artifices of the language classroom all too often act to keep the target culture at a safe distance.

The reader will note that our uptake of genre makes use of Lyotard’s notion of generic stakes, where performance within a genre is said to be controlled by the goal of that genre (cf. Lyotard 1979, 1983). Thus, the goal of the classroom genre might be said to be the achievement of good marks (or as learning, which should ideally translate into good marks); the goal of the job application, employment. But since genres, as defined for this paper, are not impervious, the question that remains is how to deal with the competing generic stakes involved when students are asked to participate in different genres at the same time. Examples of what was taking place elsewhere in the course demonstrate the different degrees of contamination of the classroom genre which, however, was rarely seriously challenged and never totally displaced.

A day at the office

The part of the course which seemed to correspond most closely to student expectations was the hour in which they worked with a limited, but varied number of what we might call “routines” of everyday French business life. Functional in approach, it took students through such genres as answering the telephone, letter writing and reading job offers. Predictably, this diversity was taken by the students as appropriate to the classroom.

Several remarks are pertinent here. Firstly, readers are reminded that the skills required to negotiate these tasks are not purely linguistic and were not treated as such. Secondly, as is standard language classroom practice, many of the tasks were contextualised within a fictional situation: in this kind of undergraduate course, it cannot always be
expected that students will have immediate need for the genres being rehearsed. Even if the teacher recommended that for the CV assignment students prepare their own because it would be “good practice”, the necessity of writing about themselves still counted as fiction. We are certainly not railing against this fictionality, but its existence allows us to bring out some moments of generic conflict. It was not always easy to suspend one’s belief in the teacher and to substitute for her, as reader of one’s letter of application, the phantom figure of an imagined French employer (was it really necessary to translate one’s qualifications, a student asked, or to give the international dialling code for Australia?) Then there is always the student who feels badly done by when a (linguistically perfect) amalgamation of textbook examples does not gain perfect marks, and who is never entirely persuaded by the argument that such a hollow repetition would be unlikely to convince anyone to employ her/him. Surely such an exercise is about good marks, not some imaginary position?

Clearly there is some confusion as to the stakes being played for here. If we want our students to rehearse “real” business situations, we need to set up those activities as a game. If we play this game too well, however, forms of assessment appropriate to the classroom are overtaken by other considerations, as when the teacher is tempted to give a higher mark to a CV which shows a stronger applicant for some (fictional) position, than to one which is as formally and linguistically appropriate, but which presents a weaker case for the job.

We see therefore that even in this relatively standard language classroom, the coincidence of pedagogical and business genres brings with it moments of conflict. We can also note that despite the best endeavours of staff and students alike, it is difficult to live out classroom fictions in such a way that the target culture enters the classroom, and is not left “out there”. Another way of putting this is that we lack practice in relating what is taking place in a French course to other cultural contexts. This lack, it was thought, would be remedied to some extent by the other parts of the course.

**Paperwork**

In some ways, the remaining hour of the course was less obvious, or less predictable. This third component of *French for Business* was not clearly
about practising French for business, and this led some students to question its validity. Its aim was to introduce students to reading francophone newspapers, with particular reference to the more challenging aspects of francophone journalism, such as *Le Monde* and the major weekly news magazines. Clearly, it is not enough for students to master a defined range of business skills such as letter writing and report presentation in order to locate themselves successfully in a francophone business environment. There are others factors which differentiate Australian from French business. All other things aside, a student unfamiliar with even the broadest sense of how the French system of government differs from the Australian would be severely under-equipped to understand a range of cultural topoi which crop up incessantly in the media, from elections to party political alliances, from seasonal strikes to *la cohabitation*. A further complicating factor is that of European unification, to which so many questions of finance, economics, marketing, distribution etc. are now subordinate. It was thus considered essential that the students be introduced to, and made to engage with, a range of issues and questions concerning France’s internal and external relations, and how they might pertain to the doing of business. This involved two kinds of classroom activities: learning about political, social and financial factors, and a set of analytical reading exercises.

Our aim here was to equip the students with tools for finding their way through the kinds of newspaper articles which even an uninitiated Francophone might find intimidating. This again went to our thesis that the genres which the course sought to encompass did not presuppose linguistic mastery. The counterpart to that assumption was that linguistic competence was also not sufficient to the acquisition of generic case. Hence some francophone students had difficulties adapting to certain generic conventions (i.e. those of written as opposed to oral skills, those of formal as opposed to familiar address, etc.), whereas there were non-francophone students familiar with business practices who took up the challenge with fluency and considerable flair.

Yet once again the classroom genre prevailed. Some students had trouble reconciling the two different exercises in that hour with a course called *French for Business*. The real issue was understanding exactly how our classroom activities might themselves be a form of cultural practice, in both senses of the word: practice for the culture and practice of the culture. We had trouble making clear that working through a complex
Teaching Language, Teaching Culture

newspaper article, isolating difficulties, and following the evolution of a story or the recurrence of certain topoi from week to week, was already an act of cultural engagement. This trouble, we believe, again stemmed from a conception of French culture as being “out there”, rather than made up of different kinds of practices, some of which (such as “reading the paper”) can be engaged with in the classroom. When this conception goes unchallenged, the classroom remains impervious to the target culture.

The well dressed explorer

Too often in French courses (as opposed to ESL or community language courses) we find ourselves treating the target culture as being far removed from the classroom. The existence of a francophone business community in Brisbane enabled us (1) to show students that French for Business might be a very useful thing; and (2) to import into the classroom the cultural practices we sought to teach in the other two hours of the course, by contextualising them in a non-fictional way. Classroom culture would, we thought, here be nudged aside by some other genre. Yet our attempt to introduce the “real world” genre into the language classroom compromised the safety net usually provided for students by the classroom genre, and engendered a significant amount of unease, in students, teachers and guests. Students were clearly uncertain about how to perform, the teachers anxious about the students’ performance, and some of the guests themselves anxious about their own performance. Some of the most spectacular examples of generic tension also come from this part of the course.

Terms of address

Obviously the formal vous would be the appropriate term of address, and rare would have been the student unable to nominate it, if questioned in metalinguistic mode. Despite this, there was some real anxiety about whether it would be used. In the particular language departments to which these students were accustomed, the informal tu was generalised; it is unusual for the students to have cause to use it, outside the realm of the role play, where there are generally problems with maintaining it. In a roleplay, all that is risked is a mild reprimand or some point penalties as appropriate. However, it is not a simple linguistic error: in this “non-classroom” genre with an interlocutor who was not a teacher, the
possibility of offence could always arise, with the students being seen as inappropriately familiar rather than grammatically forgetful.

Assessment

In briefing sessions in the week preceding each guest presentation, groups of students would introduce the field of interest of that guest, his/her business etc. In general, this was done on the basis of information supplied by the guests themselves. The exercise was institutionally validated by "being for marks." Certainly there were those who managed to negotiate the presentation genre with success; who were informative, who had clearly grounded their tutorial presentation in a serious consideration of what would be necessary to the understanding of the forthcoming guest presentation. Such outcomes represented the best of our expectations when designing this part of the course: while these students had not forgotten that this was a piece of assessment, they were also producing very successful informative work, conforming to guidelines other than those set up by the assessment task. But reality bites. There was, for example, the student who brought her own safety net along for the evening. "I've got to talk about x," she announced "I don't know why, and it's not very interesting, so I thought we'd pretend it's a press conference. Mesdames et messieurs, je vous ai convoqués ici aujourd'hui..." Some consternation (amongst teachers and students) was caused by this complete refusal to play the "real" game, and by the desire to retreat to the "language classroom" and the mask of the role play - which was obviously where this student had real success. How could she have refused the possibility of, for once, "doing something for real?" And how strange it was, as teachers, to have to penalise this successful example of generic diversity.

While this was one example of failure, other more successful moments were equally prone to generic difficulties. There was some tension about the interpretative position to be adopted, a tension which manifested itself among students and also in the marking of the presentations. To what extent did presenting a company mean the recitation of its publicity materials? What about those critical approaches which would have counted for much in other courses but which would have been inappropriate here? How could one suitably question the discourse of the cosmetics representative and demonstrate to her the
Teaching Language, Teaching Culture

problematic assumptions (about the nature of femininity and being Australian) underlying her presentation?

The venue

Another perceived generic mismatch was that of the venue. The guest sessions were scheduled for a well-used classroom, where the handsome parquetry floor was usually the worse for wear after a day of classes, and where the rows of chairs inevitably tended towards disorder. The problems here were not only ones of “smartness” - which was the concern of the student who raised the point - but went deeper. The physical disposition of the room may not have differed dramatically from that for large meetings, but for our students, ourselves and our guests, it perpetuated the classroom genre, with its focus on one person, and produced difficulties of movement which restricted contact between students and guests. Clearly, the physical and material constraints of our teaching environments are as much a part of the classroom genre as our texts, our course descriptions and assessment procedures.

The dress code

The inevitable objections on the grounds of equity issues and practicalities merit serious consideration, but insofar as they concern the application of the code are of a different order from those objections which target the validity of its existence. Were staff there to enforce linguistic but not other standards? Not since the bad old days of the sixties have teachers attempted to control forms of dress in the university classroom: we were, in terms of current classroom culture in Australia, behaving with gross generic inappropriateness. Furthermore, not only was our right to set up a dress code questioned, but the reasoning behind it: here we were obviously going too far. Dressing up (in ties) was just going to be dressing up (in costume), and despite its theatricality, a classroom isn’t a fancy dress party. There were obviously some serious reservations about playing (in a serious way) with non-verbal identity (which, incidentally, may also be found in courses where gesture is a focus of attention). Finally, there was the objection that the dress code we suggested was the wrong one for the language classroom, and, in the mind of at least one student: “They [the guests] are coming to a university and they expect to see students.” Classroom culture would prevail.
PEDAGOGICAL UPTAKES

We do not want this to be the chronicle of a failure, of a doomed attempt
to dream the impossible dream of effacing the classroom culture and
substituting for it another, with, as its conclusion, the demonstration of
the inevitable generic mixity of classroom activities and the dominance
of classroom culture. Rather, we should go on from here to see what can
be done with this co-existence of genres, and how the inevitable
discomfort might be dealt with helpfully and usefully in terms of the
students' on-going apprenticeships. Anne Freadman (1988:6) raises the
problem of the "flattening" effect the classroom genre has on generic
difference. We suggest that to diminish the effect of these flattening
forces, by fighting to validate other genres, logically means that we're
in for a bumpy ride. If however we can succeed in riding the waves
thrown up by the clash of generic cross-currents, we may actually get
somewhere.

The cosmetic representative's presentation may be taken as one of
the more telling examples of student frustration, and of how working
through it might feed back into the learning process. Across the corridor,
in another room, students would have delighted in the chance to do a
feminist analysis of cosmetics advertising. By this stage in the semester,
all were aware that this room was not the place to do that, or at least not
in the same way. Their problem was to produce a form of reaction which
would be appropriate to the business presentation genre and at the same
time display a prized set of analytical skills - or at the very least
acknowledge the existence of alternative discourses. Any pedagogically
useful analysis of the incident would of necessity recognise the double
act going on in this particular room. The teacher's job is to help students
both to consider the options available to them, and to formulate questions
which would satisfy both genres. (Have you had to adapt your marketing
strategies for Australian audiences? Does your market research show any
resistance to these assumptions about women?)

What the course we describe needed was some sustained pedagogical uptake of moments of tension such as those outlined above.
As always, students should be guided towards as precise a diagnosis of
difficulties as possible: only when these have some defined form is it
possible to tackle them effectively. As we see here, analysis of the
conflict, apparent and actual, not only points to the existence of generic difference, but sets up an important lesson in the way we may deal with generic requirements. Learning that generic mixity is inevitable, and that it may be managed productively presupposes that generic practices may be acted upon: generic sensitivity should not be equated with generic docility, or compliant obedience.

Indeed it is at times impossible for Australians, as non-natives, to enact a genre in its fullness. To take an example discussed elsewhere (Hanna 1996:268), Australian hand-writing does not conform to the expectations which underpin the French practice of graphology, widely used in the recruitment process. At stake is the very question of employability. Here, as we suggested to students, non-conformity may be made to work for the foreign applicant. But in order for it to do so, the student must be prepared to invoke and manipulate the rules of the genre ("Ayant suivi une formation anglophone, comme vous pourrez le constater à mon écriture...") (cf. also Freedman 1994:13-18). Such an example, which subtly acknowledges the importance of handwriting while simultaneously avoiding having to produce authentically French script, both works as proof of valuable experience of another culture, and demonstrates cultural adaptability. On the other hand, s/he who would persist with other Australian rules of letter writing (Cher Jean to the C.E.O. one has never met), reluctant to give up on this, and confident that such transgression will be benignly attributed to the "Aussie" character, may be risking too much. The goal of generic appropriateness may therefore be seen to be of strategic importance, rather than an end in itself. Informed non-conformity, or considered inappropriateness, may also be a strategically useful move. This has been discussed by Cryle (1992:134), Hanna (1996), and Zarate (1986:32) (see also Freedman 1994:21 on non-obedience).

Being able to invoke generic rules means that these are not the mysteriously inaccessible secrets of a great art work. While we cannot abolish classroom practice, its existence and the tensions it produces may well be a means of bringing to students' attention the existence of genre as something not only in which they are already implicated, but upon which they can act.

CONCLUSION

Generic diversity is par for the language course. However that diversity and its seemingly incoherent goals are carefully rein in by the demands
of pedagogical viability. A conservative conclusion to this paper could be a simple acknowledgment of the power of classroom culture and of the need for deference to its exigencies. But this would be to gainsay the usefulness of generic tensions in the classroom. While the scenarios we have outlined seem to point to pedagogical difficulties, we hope to have shown that expectations of generic purity are both unrealistic and unhelpful. Generic mixity is and may be managed in different, pedagogically useful ways, but pretending that generic coincidence is an aberration closes the door on potentially fruitful discussions with students of the strategic value of good genre management.

As we asserted earlier, there can be no monoculture. It is important that students be introduced to this fact of cultural competence, equally relevant to understanding their relation to their home culture. In the language classroom, the implications of this must extend to the apprenticeship of the target culture. It must involve a recognition that cultural mastery is not a separate skill which follows sequentially in the footsteps of linguistic mastery. No longer a monolith, the target culture can be revealed as an interlocking series of locally manageable practices, which students can try on without having to change their whole wardrobe.

NOTES

1 In addition to the authors, the course was taught by Professor Peter C'ryle (Romance Languages, University of Queensland), on leave at the time of writing.

2 For more on the practices involved and the problems engendered, in a business setting, see Béal (1990, 1992). For another account of factors relevant to the cultural construction of meaning, see Crozet (1996).

3 Our uptake of genre, and its relation to classroom practice, owes much to the work of Anne Freadman, in particular as outlined in Freadman (1994).

4 Freadman (1992: 261) suggests the alternative metaphor of the tramp, or vagabond, as one who looks over other peoples' fences: "the tramp suggests that to know—or practise—a genre is to know and practise the relations it entertains with other genres".

TEACHING CULTURE AND LANGUAGE FOR SPECIFIC PURPOSES: AN APPROACH TO THE DEVELOPMENT OF APPROPRIATE TEACHING MATERIAL

Gabriele Schmidt
Australian National University

INTRODUCTION

It is widely acknowledged that a foreign language cannot be taught without integrating the culture connected to the target language (Knapp and Knapp-Pothhoff 1990, Byram 1991, Müller-Jacquier 1991, Bolten 1993). However, ‘widely acknowledged’ does not mean that this integrated approach has entered classrooms, and it is even less adapted when there is not only a second language to be taught, but also a very specific content like a particular profession. Following the approach of the German textbook Deutsch im Krankenhaus (Firnhaber-Sensen and Schmidt 1994) the focus of this paper will be on the impact of the components of 1) language, 2) a very specific content and 3) culture on the development of teaching material for specific purposes. Although the approach is illustrated by a concrete case, it can serve as a model for similar projects in other languages and other subjects.

In this paper ‘culture’ focuses mainly on professional culture, emphasising that it is a widespread myth that the working conditions of a profession are independent of the cultural surroundings in which it is performed. In fact, closer comparisons show that e.g. teachers, bank clerks or nurses do different tasks in different countries, get different salaries and are viewed differently in terms of prestige.
The prestige of a specific profession often depends on historical developments, e.g. to what extent a specific culture established and developed the value of education. The answer to this question determines the length of training, the salary, working conditions, the discourse level (Clyne 1994) etc. In Germany, where school education is highly regarded, the teaching profession is a prestigious one, well-paid and requiring a long academic training. Within the nursing profession it is quite the opposite. While Australian nurses gain their qualifications through university studies and are regarded as highly skilled, German nurses get a non-academic training, are low-paid and find themselves at the very bottom of the hospital hierarchy.

Hence teaching a language for professional purposes must not ignore these differences in the professional culture.

**SPECIAL SUBJECT LANGUAGE VS. LANGUAGE FOR PROFESSIONAL PURPOSES**

In order to avoid misunderstandings in terminology some comments on the use of the term ‘special subject language’ should be made in advance. Most teaching material developed for specific purposes is labelled under the term ‘special subject language’. The project that is described in this paper does not use this term for two reasons. According to Bolten (1991) there is no clear-cut border between ‘general language’ and ‘special subject language’. For example, how should a newspaper article on the political discussion of abortion be classified? Can the language used in this article be strictly defined as medical, political or general language? It is obvious that the categories are overlapping and therefore do not help to solve the problem. Secondly Bolten argues that the term ‘special subject language’ is used for very contradictory definitions. It is used both for describing a lexicological-terminological system and for describing linguistic performance in a communicative-pragmatic sense.

Being aware of these incompatible definitions Bolten suggests an end to using ‘special subject language’ as a general term, because it is too hackneyed. Instead he suggests to use the following three terms:

- **Academic Language** used in educational contexts;
- **Language for Professional Purposes** used in a professional context; and
- **Informal Subject Language** used between experts and non-experts.
The teaching material developed in the project *German for Foreign Nursing Staff* falls into the second group.

*HOW DOES THE DEMAND FOR SPECIFIC TEACHING MATERIAL ARISE AND WHAT HAPPENS WHEN CULTURE IS IGNORED IN A LANGUAGE CURRICULUM?*

The demand for very specific teaching material arises from very concrete situations that are mostly problematic. In the project *German for Foreign Nursing Staff* it arose from the fact that in the late eighties and early nineties there was a dramatic shortage of qualified nursing staff at German hospitals. To solve the problem many hospitals recruited nursing staff from abroad, mainly from the former Yugoslavia, the Philippines and Great Britain. The recruited nurses were highly skilled, but hospital officials had completely ignored two key issues: language and culture.

Most of the foreign nurses did not have sufficient knowledge of the German language, in fact many did not know any German at all. Becoming aware of this problem, hospitals organised six-weeks intensive language courses, naively believing that such a short period would be sufficient to acquire enough linguistic skills to perform successfully in a work environment.

It seemed that the problems that occurred at hospitals with foreign nursing staff were caused by the lack of linguistic proficiency, but after interviewing representatives from those hospitals involved it soon became clear that the problem was far more complex. It seemed much more likely that many problems were caused by cultural differences, especially by the different image and content of one profession in different cultures.

For example, the majority of the foreign nursing staff working at German hospitals comes from south-eastern European countries, where nursing of ill people is done by the family, while the nurses are much more involved in medical tasks. Because of this cultural difference foreign nurses often do not regard tasks which are less specifically medical work, like washing and feeding patients, as work they should do.

In this case ignoring language and culture led to a very frustrating and explosive situation for all involved:

- on the one hand, the foreign nurses were unsatisfied with their job, because they were only allowed to do work with fewer responsibilities than in their own countries;
Teaching Language, Teaching Culture

- on the other hand, the German staff felt that their new colleagues were not a lot of help; and
- last but not least, the patients were nursed by staff with whom they could not communicate.

THE DEVELOPMENT OF TEACHING MATERIAL FOR SPECIFIC PURPOSES INTEGRATING LANGUAGE AND CULTURE

The situation as described got more and more out of control until finally the Department of Science and Research of North-Rhine Westphalia initiated a project on the development of appropriate teaching material for this very specific group of learners. The project was conducted by the Heinrich-Heine-University of Düsseldorf in close cooperation with professional experts.

The first question was which topics, material, text types etc. should be chosen. The aim was to present communicative situations, texts and exercises which were as realistic and authentic as possible. Above all, they had to be both representative and significant.

Former research activities on the language used in medicine focused mainly on the medical terminology and did not consider linguistic performance and cultural differences. To achieve more information about the latter an empirical survey was conducted at several hospitals. The following questions were of central interest:

- Which are the main areas of activities in communication?
- Who are the partners in communication in these situations?
- Which text types are used in written communication and how frequently?
- Which text types occur as reading texts and how frequently?

After an evaluation of approximately two hundred questionnaires the first result was a profile of activities (Figure 1).

One result was very surprising. It had not been expected that one of the most frequent activities would be telephoning, which is understandable, because many appointments have to be arranged by nurses. Except for paperwork, all of the other activities mentioned as very relevant are tasks which require direct contact with patients and hence require communicative skills.

143
**Figure 1: Profile of Activities**

**Figure 2: Partners in Communication**

With regard to the partners in communication the results correspond with the profile of activities. Patients are in most cases the partners of interaction and are therefore mentioned nearly as often as colleagues who are on the top rank, because many activities, like bed making, are done in cooperation with colleagues. This information about partners in communication was very important for choosing relevant and significant characters in dialogues.
As far as writing is concerned it was found that filling out forms and writing nursing reports are most important. Both text types differ to a large extent from texts which usually occur in textbooks. By contrast, forms and nursing reports require very specific skills in writing. Knowing the numbers and the correct use of abbreviations is more important than the ability to construct 'complete sentences'. To prepare students for these tasks many exercises start with a listening text and the learners are asked to take notes and later to transfer the information to charts and forms.
With regard to reading comprehension the information gained showed that articles from scientific journals, for instance, are not read frequently, whereas simple nursing reports and instructions given by doctors are much more relevant. This result supported the authors' choice of presenting a wide range of authentic texts while texts with a rather scientific orientation do not occur.

Altogether the survey can be considered as important for many decisions that had to be taken in the process of constructing the textbook. The results helped to avoid developing yet another textbook which professional experts might consider to be unrealistic and therefore not useful. Furthermore, the results supported the authors in defending their approach against criticisms from colleagues and editors.

**COURSEBOOK CONCEPTION**

Having gained these results a scheme for twelve chapters was developed. For each chapter a very general topic was chosen which was matched with an example for communication and a concrete speech act. The selection of topics and communicative situations is based upon the results of the survey. All topics deal with everyday situations like making beds, distributing meals etc. Because of the significance of telephoning a whole chapter was developed on this topic.

The next question was which speech devices, which vocabulary and which grammatical structures are necessary to perform successfully in each situation. The material was developed for beginners with very little prior knowledge of German. The progression of grammar is oriented towards the basics of German grammar and the particularities of the language for this specific purpose, like the passive voice in present tense, which is often used in this context.

As much as possible each grammatical issue is matched with a corresponding speech device. For example, most German verbs used in the context of making beds are separable or non-separable verbs (e.g. *abziehen, beziehen, aufschütteln* etc.).

With regard to vocabulary it was less important to introduce medical terminology than to draw attention to the appropriate German synonyms. In contrast to other languages the medical terms of Greek or Latin origin do not belong to everyday German. Hence, the synonyms are necessary for the communication between nursing staff and patients.
Teaching Language, Teaching Culture

The last two areas dealt with 1) specific skills, like pitfalls of numbers, abbreviations and filling out forms, and 2) cultural differences and etiquette.

An example of one chapter integrating language, content and culture is illustrated by Figure 5 below.

<table>

Figure 5: Chapter 3

INTEGRATING CULTURE

The approach for integrating and teaching culture into teaching material for specific purposes can be divided into three steps:

1. Giving information about the new culture
2. Encouraging a comparison between the new culture and one’s own cultural background
3. Exposing learners to semi-authentic situations

These steps are discussed below.

Giving information about the new culture

Although the whole coursebook reflects the image of the profession of nursing staff in Germany, most obvious cultural differences are pointed out. For example, German hospitals are structured very hierarchically which is reflected in the ways of addressing each other. Not knowing these unspoken rules can cause problems with colleagues or superiors. To prevent the latter the coursebook contains many dialogues which show
how to address someone in a formal (Sie) or informal (du) situation.

Another exercise to illustrate the hierarchical structure is a pyramid graph in which learners have to fill in the different professions, departments and tasks represented in a hospital (see Figure 6). For learners who are not familiar with the German hospital structure this exercise is very difficult, but teachers are meant to encourage their learners to 'have a guess'. Exploring and discussing why answers are wrong provide a good starting point for cultural comparisons.

**Figure 6:** Pyramid graph

Furthermore, important cultural differences are summarised in so-called 'memory boxes', little double-framed boxes which draw special attention to cultural differences that occur in dialogues and exercises without being discussed.

**Figure 7:** Memory box
Teaching Language, Teaching Culture

Cultural differences in texts are illustrated by presenting only authentic texts such as patient admission forms, medication instructions etc.

Encouraging a comparison between the new culture and one's own cultural background

Having sensitized learners to new cultural norms, the next step is to encourage them to compare this new knowledge with their own cultural background. This comparison helps to identify possible 'critical incidents' which are in most cases responsible for problems in intercultural contacts. At the same time comparative exercises enable learners “to deconstruct their monolingual and monocultural world view” (Crozet 1996). Comparisons can be initiated through simple discussions or authentic audio-visual material.

Most materials developed for teaching a second language stop at this step ignoring the fact that being aware of one’s own cultural background and of the cultural codes of a different culture does not show what is going to happen when these two cultures interact with each other (Bolten 1993).

Although there has not been much research in this area so far, some interactive approaches (Knapp and Knapp-Potthoff 1990) have shown that intercultural communication does not necessarily reflect the cultural norms of the cultures being involved. Instead, intercultural communication is a dynamic process which is to a large extent determined by ‘expectations of being different’. A German patient most likely does not expect a foreign nurse to behave like a German and vice versa. The expectations on both sides are different and hard to predict.

With regard to this unpredictability it is necessary to support learners in developing a cultural awareness by developing strategies for responding to intercultural situations. The third step, therefore, involves exposing the learners to such situations.

Exposing learners to semi-authentic situations in which they are confronted with different cultural behaviour

This confrontation usually takes place in role-plays, which allow learners to practise and experience new behaviour through learning-by-doing in a safe environment (Crozet 1996).
One example taken from the coursebook *Deutsch im Krankenhaus* is an exercise in which the learners are to cope with three different patients, who are all very difficult to handle. The task is to simulate the situation and to react to the patients. While two students play the situation the others are observers and are meant to take notes about the scene. An evaluation card in the book gives criteria for observation, e.g. does the nurse communicate sufficiently and loudly enough with the patient, etc. (see Figure 8).

**Die Beschwerden**

5 Überlegen Sie bitte in der Gruppe, wie Sie als Krankenschwester/-pfleger mit folgenden Patienten umgehen:

<table>
<thead>
<tr>
<th>Patient A</th>
<th>Patient C</th>
</tr>
</thead>
<tbody>
<tr>
<td>- macht nicht richtig mit</td>
<td>- ist sehr negativ</td>
</tr>
<tr>
<td>- ist schlaftrig und schwer zu aktivieren</td>
<td>- schimpft über alles</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Patient B</th>
</tr>
</thead>
<tbody>
<tr>
<td>- ist sehr sensibel</td>
</tr>
<tr>
<td>- fängt schnell an zu weinen</td>
</tr>
</tbody>
</table>

Bilden Sie bitte Paare, spielen Sie jeder einmal Krankenschwester und einmal der oben beschriebenen Patienten. Die Aufgabe der Krankenschwester ist, den Patienten ins Bett zu waschen und zu versorgen. Schauen Sie sich bitte vorher die Beobachtungskarte an, auf der andere Kurstitelnahme ihre Beobachtungen über das Verhalten der Krankenschwester dokumentieren.

**Figure 8:** Evaluation card for observation

Teaching Language, Teaching Culture

CONCLUSION

Second language teaching for professional purposes is different from more general language teaching situations, because it has to prepare learners in a limited period of time for very specific tasks which often carry a lot of responsibility. The development of appropriate teaching material requires cooperation between language and professional experts. Furthermore, in order to be able to choose significant topics, communicative situations and texts, surveys have to be carried out whenever new materials are developed. Ignoring the cultural dimension by only focusing on language and content can cause crucial consequences. The chosen material and types of exercises must integrate all three components: language, content and culture.
